

## **CONTENTS**

### **KCS 302 : Computer Organization & Architecture**

#### **UNIT - 1 : INTRODUCTION (1-1 B to 1-23 B)**

Functional units of digital system and their interconnections, buses, bus architecture, types of buses and bus arbitration. Register, bus and memory transfer. Processor organization, general registers organization, stack organization and addressing modes.

#### **UNIT - 2 : ARITHMETIC & LOGIC UNIT (2-1 B to 2-25 B)**

Look ahead carries adders. Multiplication: Signed operand multiplication, Booths algorithm and array multiplier. Division and logic operations. Floating point arithmetic operation, Arithmetic & logic unit design. IEEE Standard for Floating Point Numbers.

#### **UNIT - 3 : CONTROL UNIT (3-1 B to 3-37 B)**

Instruction types, formats, instruction cycles and sub cycles (fetch and execute etc), micro operations, execution of a complete instruction. Program Control, Reduced Instruction Set Computer, Pipelining. Hardwire and micro programmed control: micro programme sequencing, concept of horizontal and vertical microprogramming.

#### **UNIT - 4 : MEMORY (4-1 B to 4-30 B)**

Basic concept and hierarchy, semiconductor RAM memories, 2D & 2 1/2D memory organization. ROM memories. Cache memories: concept and design issues & performance, address mapping and replacement. Auxiliary memories: magnetic disk, magnetic tape and optical disks. Virtual memory: concept implementation.

#### **UNIT - 5 : INPUT / OUTPUT (5-1 B to 5-21 B)**

Peripheral devices, I/O interface, I/O ports, Interrupts: interrupt hardware, types of interrupts and exceptions. Modes of Data Transfer: Programmed I/O, interrupt initiated I/O and Direct Memory Access, I/O channels and processors. Serial Communication: Synchronous & asynchronous communication, standard communication interfaces.

#### **SHORT QUESTIONS (SQ-1 B to SQ-17 B)**

#### **SOLVED PAPERS (2014-15 TO 2022-23) (SP-1 B to SP-64 B)**

# 1

**Answer**  
Block diagram of computer's CPU :

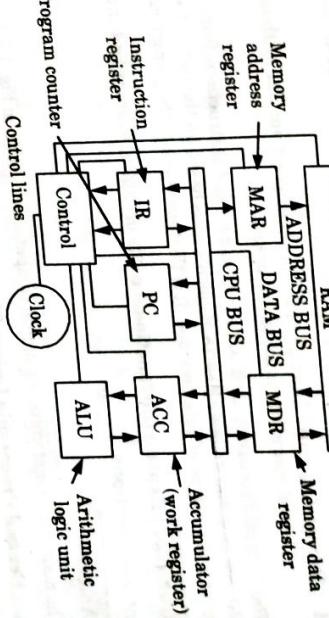

Fig 1.1.1.

A computer performs five major operations. These are :

1. It accepts data or instructions as input.
2. It stores data and instruction.
3. It processes data as per the instructions.
4. It controls all operations inside a computer.
5. It gives results in the form of output.

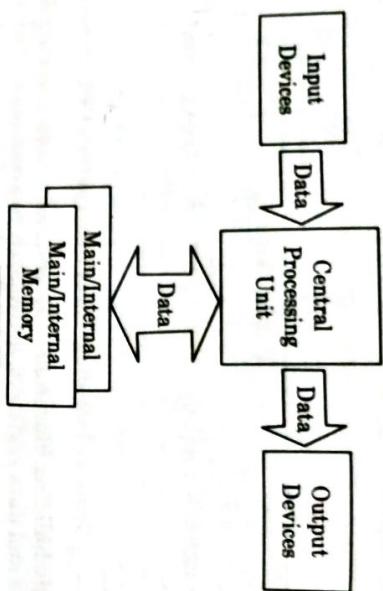

**Arrangement of CPU, memory, input/output to work as a computer.**

Fig 1.12.

- a. **Input unit:** This unit is used for entering data and programs into the computer system by the user for processing.

- b. **Storage unit:** The storage unit is used for storing data and instructions before and after processing.

- c. **Output unit:** The output unit is used for storing the result as output produced by the computer after processing.

- d. **Processing unit:** The task of performing operations like arithmetic and logical operations is called processing.

The Central Processing Unit (CPU) takes data and instructions from the storage unit and makes all sorts of calculations based on the instructions given and the type of data provided. It is then sent back to the storage unit.

**Ques 1.2.** Explain the functional units of digital system and their interconnections.

**Answer**

The main functional units of a digital computer are shown in Fig. 1.2.1.

**1. Central Processing Unit (CPU):**

- The CPU is the brain of a computer system.
- This unit takes the data from the input devices and processes it according to the set of instructions called program.
- The output of processing of the data is directed to the output devices.
- CPU has two major parts called ALU and Control Unit.

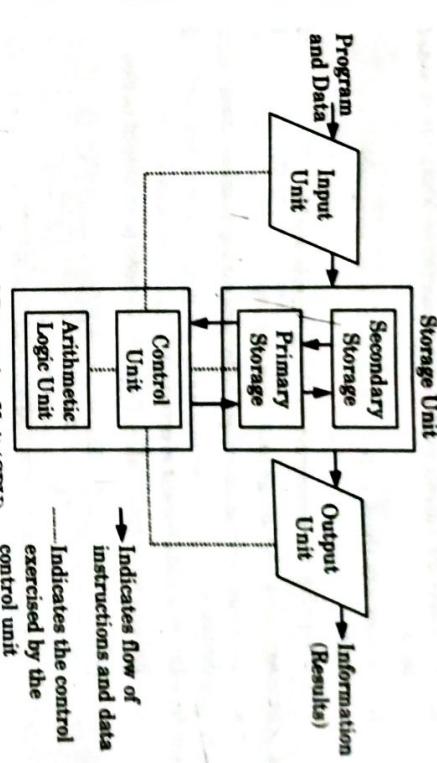

Fig 1.2.1. Functional unit of digital computer.

**i. Arithmetic Logic Unit (ALU):**

- a. ALU is responsible for carrying out following operations :

- Arithmetic operations on data by adding, subtracting, multiplying and dividing one set with another.
- Logical operations by using AND, OR, NOT and exclusive-OR operation which is done by analyzing and evaluating data.

- b. ALU of a computer system is the place where actual execution of instructions takes place during processing operation.

**ii. Control Unit (CU):**

- This unit is mainly used for generating the electronic control signals for the synchronization of various operations.
- All the related functions for program execution such as memory read, memory write, I/O read, I/O write, execution of instruction, are synchronized through the control signal generated by the control unit.
- It manages and controls all the operations of the computer.
- Input unit : An input unit performs following functions :
  - It accepts (or reads) instructions and data from outside world.
  - It converts these instructions and data in computer acceptable form.
  - It supplies the converted instructions and data to computer system for further processing.

**3. Output unit :** An output unit performs following functions :

- It accepts the results produced by a computer, which are in coded form.
- It converts these coded results to human acceptable (readable) form.
- It supplies the converted results to outside world.

**4. Storage unit :** A storage unit holds (stores) :

- Data and instructions required for processing (received from input devices).
- Intermediate results of processing.
- Results for output, before they are released to an output device.

**PART-2**

Bus, Bus Architecture, Types of Buses.

Questions-Answers

Long Answer Type and Medium Answer Type Questions

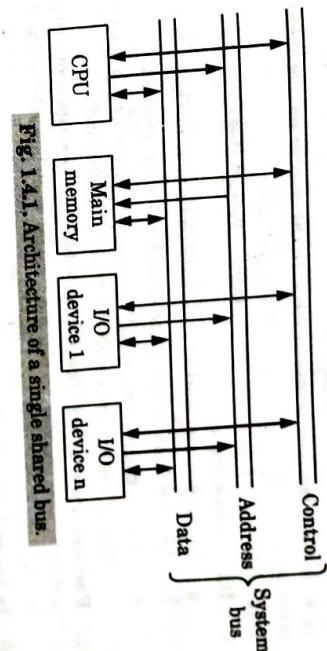

Fig. 1.4.1. Architecture of a single shared bus.

3. The principle use of the system bus is high-speed data transfer between the CPU and memory.

1. A bus is a group of wires connecting two or more devices and providing a path to perform communication.
2. A bus that connects major computer components/modules (CPU, Memory, I/O) is called a system bus.
3. These system buses are separated into three functional groups :
  - i. **Data bus :**  
The data bus lines are bidirectional.
  - ii. **Address bus :**  
The address bus consists of 8, 16, 32 or more parallel lines.
  - iii. **Control bus :**
    - a. It is a unidirectional bus.
    - b. The address bus consists of 16, 20, 24 or more parallel lines.  
The CPU sends out the address of the memory location or I/O port that is to be written or read by using address bus.

- The computer bus consists of two parts, the address bus and a data bus. The data bus transfers actual data, whereas the address bus transfers address or memory location of where the data should go.
- The bus provides physical links and the means of controlling the communication exchange of signals over the bus. Fig. 1.4.1 depicts the organization of a single shared bus.

**Answer****Que 1.4.** Describe the architecture of bus.**PART-3**

Questions-Answers

Long Answer Type and Medium Answer Type Questions

**Que 1.5.** Discuss the bus arbitration.

OR

**Write a short note on bus arbitration.****AKTU 2014-15, Marks 06****Answer**

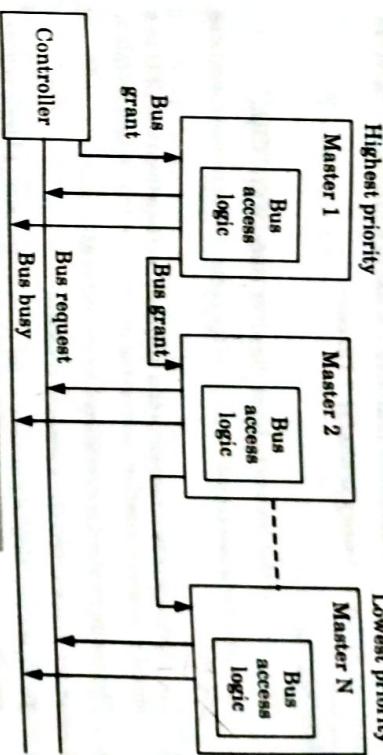

1. Bus arbitration is a mechanism which decides the selection of current master to access bus.
2. Among several masters and slave units that are connected to a shared bus, it may happen that more than one master or slave units will request access to the bus at the same time.
3. In such situation, bus access is given to the master having highest priority.
4. Three different mechanisms are commonly used for this :

**i. Daisy chaining :**

- a. Daisy chaining method is cheaper and simple method.
- b. All master make use of the same line for bus request.
- c. The bus grant signal serially propagates through each master until it encounters the first one that is requesting.

**ii. Parallel arbitration :** The parallel arbitration consists of priority encoder and a decoder. In this mechanism, each bus arbiter has a bus request output line and input line.**iii. Independent priority :** In this each master has separate pair of bus request and bus grant lines and each pair has a priority assigned to it.**Que 1.6.** Discuss the advantages and disadvantages of polling and daisy chaining bus arbitration schemes.**OR****AKTU 2015-16, Marks 10****Explain daisy changing method.****disadvantages.****Write its advantages and****Answer****Daisy chaining :**

1. In this, all masters make use of the same line for bus request.
2. The bus grant signal serially propagates through each master until it encounters the first one that is requesting access to the bus.
3. This master blocks the propagation of the bus grant signal, activates the busy line and gains control of the bus.
4. Therefore any other requesting module will not receive the grant signal and hence cannot get the bus access.

**Fig. 1.6.1. Daisy chaining method.****Advantages of daisy chaining :**

1. It is a simple and cheaper method.
2. It requires the least number of lines and this number is independent of the number of masters in the system.

**Disadvantages of daisy chaining :**

1. The propagation time delay of bus grant signal is proportional to the number of masters in the system. This makes arbitration time slow and hence limits the number of master in the system.
2. The priority of the master is fixed by the physical location of master.
3. Failure of any one master causes the whole system to fail.

**Advantages of polling bus arbitration :**

1. If the one module fails entire system does not fail.
2. The priority can be changed by altering the polling sequence stored in the controller.

**Disadvantages of polling bus arbitration :**

1. It requires more bus request and grant signals ( $2 \times n$  signals for  $n$  modules).
2. Polling overhead can consume a lot of CPU time.

**PART-4****Register, Bus and Memory Transfer.****Questions-Answers****Long Answer Type and Medium Answer Type Questions**

**Que 1.7.** What is memory transfer? What are different registers associated for memory transfer? Discuss.

**Answer**

- Memory transfer means to fetch (Read) or store (Write) data.
- The read operation transfers a copy of the content from memory location to CPU.
- The store operation transfers the word information from the CPU to a specific memory location, destroying previous content of that location.
- The memory word is symbolized by the letter  $M$ .

**Registers associated for memory transfer:**

- There are two registers associated for memory transfer : address register and data register.
- The required information is selected from the memory location by address. It is stored in the Address Register (AR).
- The data is transferred to another register called Data Register (DR).

4. Consider a simple read operation,

Read :  $DR \leftarrow M[AR]$

Here, the information is transferred into Data Register (DR) from the memory word  $M$  selected by the addresses in Address Register [AR]. The write operation is denoted as,

Write :  $M[AR] \leftarrow B$

**Que 1.8.** Explain the operation of three state bus buffers and show its use in design of common bus.

**AKTU 2016-17, Marks 15**

**Answer**

- A three state gate is a digital circuit that exhibits three states.
- Two of the states are signals equivalent to logic 1 and 0.
- The third state is a high-impedance state.
- The high-impedance state behaves like an open circuit, which means that the output is disconnected and does not have logic significance.
- Three state gates may perform any conventional logic, such as AND or NAND.
- However, the one most commonly used in the design of a bus system is the buffer gate.
- The graphic symbol of a three state buffer gate is shown in Fig. 1.8.1.

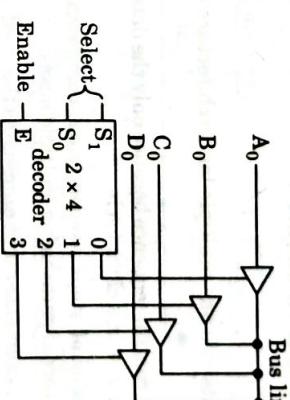

**Fig. 1.8.1.**

**1-10 B (CS/IT-Sem-3)**

**Introduction**

- The control input determines the output state.
- When the control input is equal to 1, the output is enabled and the gate behaves like any conventional buffer, with the output equal to the normal input.
- When the control input is 0, the output is disabled and the gate goes to a high state, regardless of the value in the normal input.
- A large number of three state gate outputs can be connected with wires to form a common bus line without endangering loading effects.

**Fig. 1.8.2.**

- The outputs of four buffers are connected together to form a single bus line.
- The control inputs to the buffers determine which of the four normal inputs will communicate with the bus line.

- Not more than one buffer may be in the active state at any given time.
- To construct a common bus for four registers of  $n$  bits each using three state buffers, we need  $n$  circuits with four buffers in each.
- Each group of four buffers receives one significant bit from the four registers.
- Only one decoder is necessary to select between the four registers.

**Que 1.9.** Explain why the single shared bus is so widely used as an interconnection medium in both sequential and parallel computers. What are its main disadvantages?

**Answer**

- Single shared bus is so widely used as an interconnection medium in both sequential and parallel computer because of following reasons :
- The shared bus is the simplest and least expensive way of connecting several processors to a set of memory modules.

2. It allows compatibility and provides ease of operation and high bandwidth.

**Disadvantages of single shared bus are :**

1. The main disadvantage of the shared bus is that its throughput limits the performance boundary for the entire multiprocessor system. This is because at any time only one memory access is granted, likely causing some processors to remain idle. To increase performance by reducing the memory access traffic, a cache memory is often assigned to each processor.
2. Another disadvantage of the shared bus design is that, if the bus fails, catastrophic failure results. The entire system will stop functioning since no processor will be able to access memory.

**Que 1.10.** What is the benefit of using multiple bus architecture compared to a single bus architecture ?

**Answer**

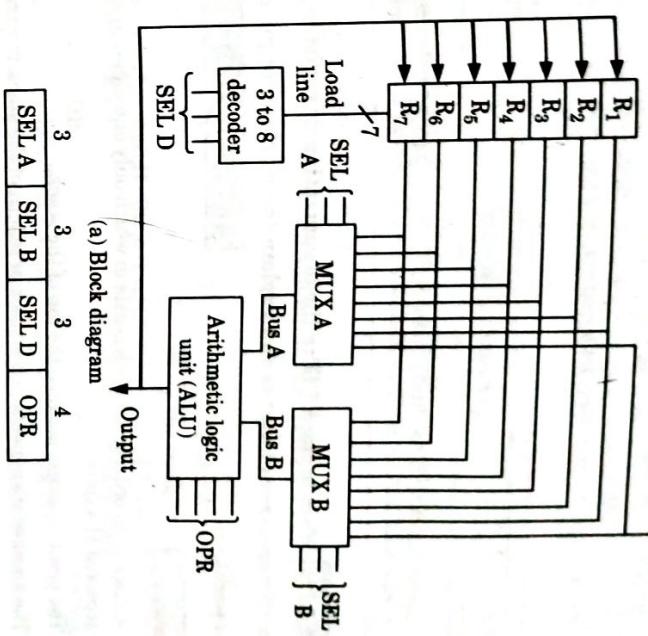

Following are the benefits of using multiple bus architecture compared to single bus architecture :

1. Single bus have long control sequence because only the data item can be transferred over the bus in a clock cycle.
2. To reduce the number of steps needed, most commercial processor provides multiple internal paths using multiple buses.
3. The introduction of incrementer unit eliminates the need to add port to the PC using the main ALU.
4. By providing more paths for data transfer, a significant reduction in the number of clock cycles needed to execute an instruction is achieved.

**PART-5**

**Processor Organization, General Register Organization.**

**Fig. 1.11.1. General-purpose register based organization.**

(b) Control word

3	3	3	4
SEL A	SEL B	SEL D	OPR

**Fig. 1.11.1. General-purpose register based organization.**

**Que 1.11.** Explain general-purpose register based organization.

**Answer**

1. In this organization, the registers communicate with each other not only for direct data transfers, but also while performing various micro-operations.

2. Seven registers are used for general purpose, the output of each register is connected to two multiplexer (MUXs) inputs.
3. Three select lines are used to select any one of the seven registers and the contents of selected registers are supplied to the inputs of ALU.
4. The buses A and B are used to form the inputs to the common arithmetic logic unit (ALU).
5. The operation to be performed is selected in the ALU and is determined by the arithmetic or logic micro-operation by using function select lines (OPR).
6. The result of the micro-operation is available as output data and also goes into the inputs of all the registers.
7. Any one of the destination register receives the information from the output bus which is selected by a decoder.

**PART-6****Stack Organization.****Questions Answers****Long Answer Type and Medium Answer Type Questions**

**Que 1.12.** What is stack? Give the organization of register stack with all necessary elements and explain the working of push and pop operations.

**Answer**

1. A stack is an ordered set of elements in which only one element can be accessed at a time.
2. The point of access is called the top of the stack.
3. The number of elements in the stack or length of the stack is variable.
4. Items may only be added or deleted from the top of the stack.
5. A stack is also known as a pushdown list or a Last-In-First-Out (LIFO) list.

**Organization of register stack :**

Consider the organization of a 64-word register stack as illustrated in Fig 1.12.1.

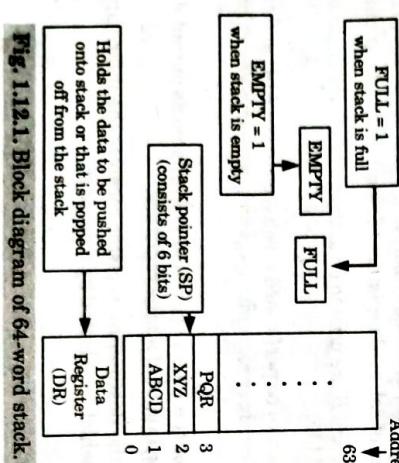

Fig. 1.12.1. Block diagram of 64-word stack.

**1-14 B (CS/IT-Sem-3)**

The four separate registers used in the organization are :

1. **Stack Pointer register (SP) :** It contains a value in binary each of 6 bits, which is the address of the top of the stack. Here, the stack pointer SP contains 6 bits and SP cannot contain a value greater than 11111 i.e., value 63.
2. **FULL register :** It can store 1 bit information. It is set to 1 when the stack is full.
3. **EMPTY register :** It can store 1 bit information. It is set to 1 when stack is empty.
4. **Data Register (DR) :** It holds the data to be written into or to be read from the stack.

**Working of POP and PUSH:**

**POP (Performed if stack is not empty i.e., if EMPTY = 0) :**

Read item from the top of stack

DR  $\leftarrow$  M[SP]

SP  $\leftarrow$  SP - 1

If (SP = 0) then (EMPTY  $\leftarrow$  1)

FULL  $\leftarrow$  0

**PUSH (Performed if stack is not full i.e., if FULL = 0) :**

Increment stack pointer

Write item on top of the stack

M[SP]  $\leftarrow$  DR

Decrement stack pointer

Check if stack is empty

EMPTY  $\leftarrow$  0

Mark the stack not empty

**Que 1.13.** What is a memory stack? Explain its role in managing subroutines with the help of neat diagrams.

**AKTU 2016-17, Marks 15**

**Answer**  
Memory stack: Memory stack is a series of memory spaces that is used in the processes that is done by processor and is temporarily stored in registers.

**Role in managing subroutines :**  
The stack supports program execution by maintaining automatic process-state data.

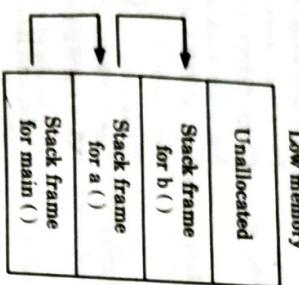

1. The stack supports program execution by maintaining automatic process-state data.
2. If the main routine of a program, for example, invokes function *a()*, which in turn invokes function *b()*, function *b()* will eventually return control to function *a()*, which in turn will return control to the main () function as shown in Fig 1.13.1.
3. To return control to the proper location, the sequence of return addresses must be stored.
4. A stack is well suited for maintaining this information because it is a dynamic data structure that can support any level of nesting within memory constraints.

## I-15B (CS/IT-Sem-3)

**Comparison between register stack and memory stack:**

- | S.No. | Register stack  | Memory stack   |
|-------|---|--|
| 1.    | Register stacks are momentary spaces for internal processes that are being done by the processor. | Memory stacks are a series of memory spaces that is used in the processes that is done by the processor and are temporarily stored in registers. |
| 2.    | Register stack is generally on (CPU).   | Memory stack is on RAM.  |
| 3.    | Access to register stack is faster.   | Access to memory stack is slower.  |
| 4.    | It is limited in size.  | It is large in size.   |

5. When a subroutine is called, the address of the next instruction to execute in the calling routine is pushed onto the stack.
6. When the subroutine returns, this return address is popped from the stack, and program execution jumps to the specified location as shown in Fig. 1.13.2.

**Fig. 1.13.1. Stack management.**

7. The information maintained in the stack reflects the execution state of the process at any given instant.

8. In addition to the return address, the stack is used to store the arguments to the subroutine as well as local (or automatic) variables.
9. Information pushed onto the stack as a result of a function call is called a frame. The address of the current frame is stored in the frame or base pointer register.
10. When a subroutine is called, the frame pointer for the calling routine is also pushed onto the stack so that it can be restored when the subroutine exits.

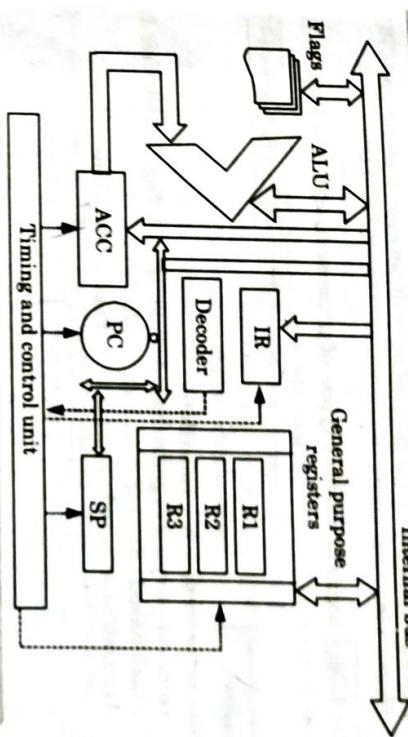

**Ques 1.14.** What is the stack organization? Compare register stack and memory stack.

**Answer**

Stack organization : Refer Q. 1.12, Page 1-13B, Unit-1.

- Ques 1.15.** Explain an accumulator based central processing unit organization with block diagram.

**Answer**

**Fig. 1.15.1. Block diagram of accumulator based CPU organization.**

1. ALU : A most generic computer system is composed of a unit to do arithmetic, shift and logical micro-operations commonly known as ALU of CPU.
2. Program Counter (PC) : This keeps track of the instruction address in memory from where the next instruction needs to be fetched. The instructions are stored in memory in an order decided by programmer.
3. General purpose registers (R1, R2, R3) : It suggests that the registers are involved in operations like load inputs, store intermediate results of arithmetic, logical and shift, micro-operations. The initial inputs are loaded into registers from memory and final results are later moved into memory.

- 4. Accumulator (ACC) :** This block acts as the default temporary storage register location for all mathematical operations in ALU.
- 5. Instruction Register IR and Decoder :** After instruction is fetched from the memory it's stored in Instruction Register. The instruction is then decode by the decoder.
- 6. Stack pointer (SP) :** Stack pointer is involved in managing the stack transfers during and program execution.
- 7. Timing and control unit :** This block manages the sequencing of events on a timeline between various components of a CPU. All the blocks are controlled in a manner to optimize the computational power of the unit by minimizing the failures.
- 8. Flags :** Flags are also registers or bits inside registers which are set or cleared for a particular condition on an arithmetic operation. Some of the most common flags are :
- Sign :** Is used to identify the set/reset of most significant bit of the result.
  - Carry :** Is used to identify, a carry during addition, or borrow during subtraction/comparison.
  - Parity :** Set if the parity is even. Refer parity from here.
  - Zero :** To identify when the result is equal to zero.
- 9. Bus sub-system :** All the data transfers in-between memory and CPU registers including instruction fetches are carried over bus.

**Que 1.16. Explain various types of processor organization.****AKTU 2015-16, Marks 10****Answer****Types of processor organizations :**

- General-purpose register based :** Refer Q. 1.11, Page 1-11B, Unit-1.
- Stack based :** Refer Q. 1.12, Page 1-13B, Unit-1.
- Accumulator based :** Refer Q. 1.15, Page 1-16B, Unit-1.

## PART-7

*Addressing Modes.*

Questions-Answers
Long Answer Type and Medium Answer Type Questions

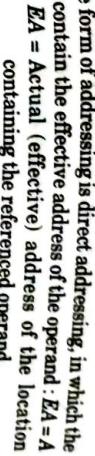

**Que 1.17.** Write short note on relative addressing mode and indirect addressing mode.

**OR**

- Explain the following addressing modes with the help of an example each :**
- i. Direct
  - ii. Register indirect
  - iii. Implied
  - iv. Immediate
  - v. Indexed

**Answer**

- i. Direct:**  
A very simple form of addressing is direct addressing, in which the address field contain the effective address of the operand :  $EA = A$  where,

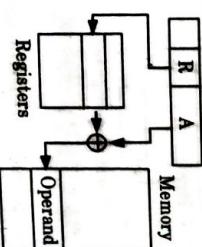

**Fig 1.17.1 Direct.****ii. Register indirect**

- iii. Implied**  
**AKTU 2014-15, Marks 10**

- iv. Immediate**

- v. Indexed**

- ii. Displacement addressing :**
- A very powerful mode of addressing combines the capabilities of direct addressing and register indirect addressing.
  - It is known by a variety of names depending upon the content of its use but the basic mechanism is the same.
  - Displacement addressing requires that the instruction have two address fields, at least one of which is explicit.
  - The value contained in one address field (value = 4) is used directly.
  - The other address field or an implicit reference based on opcode, refers to a register whose contents are added to A to produce the effective address.

**Fig 1.17.2 Displacement addressing.**

**iii. Relative addressing :**

1. Relative addressing means that the next instruction to be carried out is an offset number of locations away, relative to the address of the current instruction.

2. Consider this bit of pseudo-code

Jump + 3 if accumulator == 2

Code executed if accumulator is NOT = 2

Jump + 5 (unconditional relative jump to avoid the next line of code)

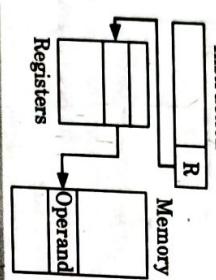

In the code, the first line of code is checking to see if the accumulator has the value of 2 then the next instruction is 3 lines away.

4. This is called a conditional jump and it is making use of relative addressing.

**iv. Register indirect mode :**

1. Register indirect mode is similar to indirect addressing.  
2. The only difference is whether the address field refers to a memory location or a register.

3. Thus, for register indirect address, EA = (R)

**Fig. 1.174 Register indirect.**

**v. Implied mode:**

1. In this mode, the operands are specified implicitly in the definition of the instruction.  
2. All register reference instructions that use an accumulator are implied mode instructions.  
3. Zero address instructions in a stack-organized computer are implied mode instruction since the operands are implied to be on top of the stack. It is also known as stack addressing mode.

**Fig. 1.174 Implied mode.**

**vi. Immediate mode:**

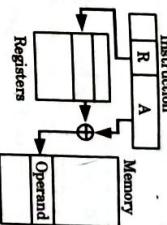

1. In this mode, the operand is specified in the instruction itself.  
2. The operand field contains the actual operand to be used in conjunction with the operation specified in the instruction.

**Fig. 1.175 Immediate mode.**

**vii. Indexed:**

1. The effective address of the operand is generated by adding a constant value to the contents of a register.  
2. The register used may be either a special register for this purpose or more commonly, it may be any one of a set of general purpose registers in the CPU.  
3. It is referred to as an index register. We indicate the index mode symbolically as,  $X(R)$  where X denotes a constant and R is the name of register involved.  
4. The effective address of the operand is given by,  $EA = X + [R]$   
5. In the process of generating the effective address, the contents of the index register are not changed.

**Fig. 1.176 Indexed.**

**Example:**

## Address

## Memory

PC = 200

200 Load to AC Mode

201 Address = 500

202 Next instruction

R1 = 400

400 XR = 100

399 450

400 700

500 800

600 900

702 325

800 300

**1-22 B (CS/IT-Sem-3)**

Here the contents of R2 are first used as an EA then these are incremented.

**Auto decrement mode :**

In this mode the contents of a register specified in the instruction are decremented.

1. In this mode the contents of a register specified in the instruction are decremented.

2. These contents are then used as the effective address of the operand.

**Example :** Add - (R2), R0

Here the contents of R2 are first decremented and then used as an EA for the operand which is added to the content of R0.

**Que 1.20.** How addressing mode is significant for referring memory ? List and explain different types of addressing modes.

**AKTU 2016-17, Marks 15**

**Que 1.18.** What is difference between implied and immediate addressing modes ? Explain with an example.

**Answer**

S.No.	Implied addressing mode	Immediate addressing mode
1.	No operand is specified in the instruction.	Operand is specified in the instruction itself.
2.	The operands are specified implicitly in the definition of instruction.	The operands are contained in an operands field rather than an address field.
3.	This mode is used in all register reference instructions.	This mode is very useful for initializing the registers to a constant value.
4.	<b>Example :</b> The instruction "Complement Accumulator" written as : CMA.	<b>Example :</b> The instruction : ADD 05

**Que 1.19.** Describe auto increment and auto decrement addressing modes with proper example ?

**Answer**

**Auto increment mode :**

1. In this mode the Effective Address (EA) of the operand is the content of a register specified in the instruction.
2. After accessing the operands, the contents of this register are incremented to point to the next item in the list.

**Example :** Add (R2) +, R0

- Q. 1.** Auto increment mode : Refer Q. 1.1.
- Q. 2.** Write a short note on bus arbitration. Refer Q. 1.5.

- Q. 3.** Discuss the advantages and disadvantages of polling and daisy chaining bus arbitration schemes. Refer Q. 1.6.

**Q.4. Explain the operation of three state bus buffers and show its use in design of common bus.**

Ans Refer Q. 1.8.

**Q.5. What is stack ? Give the organization of register stack with all necessary elements and explain the working of push and pop operations.**

Ans Refer Q. 1.12.

**Q.6. What is a memory stack ? Explain its role in managing subroutines with the help of neat diagrams.**

Ans Refer Q. 1.13.

**Q.7. Explain various types of processor organization.**

Ans Refer Q. 1.16.

**Q.8. Explain the following addressing modes with the help of an example each :**

- i. Direct
- ii. Register indirect
- iii. Implied
- iv. Immediate
- v. Indexed

Ans Refer Q. 1.17.

**Q.9. How addressing mode is significant for referring memory?**

List and explain different types of addressing modes.

Ans Refer Q. 1.20.

**PART - 1**

**Arithmetic and Logic Unit : Look Ahead Carries Adders.**

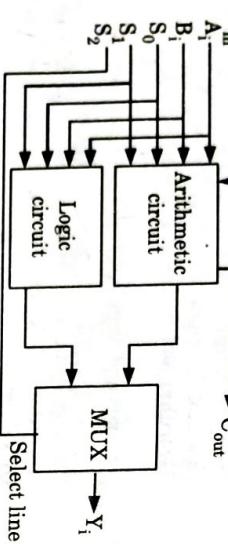

**Questions-Answers****Long Answer Type and Medium Answer Type Questions**

**Que 2.1.** Describe sequential Arithmetic and Logic Unit (ALU) using proper diagram.

**AKTU 2017-18, Marks 07**

**Answer**

1. By combining arithmetic and logic circuits with the help of multiplexer, we can get the arithmetic and logic units.

**Fig. 2.1.1.** Block diagram of ALU.

2. When the mode select line  $S_2 = 0$ , this ALU acts as an arithmetic circuit, so the output of arithmetic circuit is transferred as final output.
3. Otherwise ( $S_2 = 1$ ) the output of the logic circuit is transferred as final output.
4. Based on the mode select  $S_2$  and input carry  $C_{in}$ , we increase or decrease the number of arithmetic and logic operations.
5. When  $S_2 = 0$ , the ALU performs arithmetic operation and when  $S_2 = 1$ , with  $C_{in} = 0$ , the ALU performs logic operations.
6. We know that the carry input is not required in the logic circuits.
7. When logic operation is selected ( $S_2 = 1$ ), the carry input must be zero.
8. This given us the output sum in full adder circuit as

$$\begin{aligned} Y_i &= A_i \oplus B_i \oplus C_i \\ Y_i &= A_i \oplus B_i \end{aligned}$$

**Que 2.2.** Write short note on look ahead carry adders.

**Answer**

1. A Carry Look Ahead adder (CLA) or fast adder is a type of adder used in digital logic.

**Computer Organization & Architecture****2-3 B (CSIT-Sem-3)**

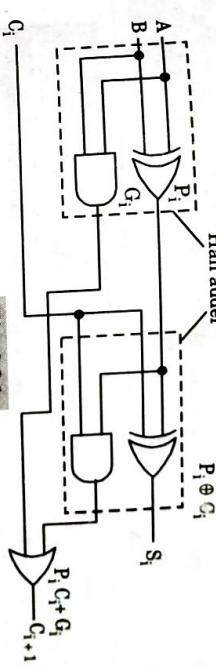

2. A carry look ahead adder improves speed by reducing the amount of time required to determine carry bits.
3. The carry look ahead adder calculates one or more carry bits before the sum, which reduces the waiting time to calculate the result of the larger-value bits of the adder.

value bits of the adder.

4. Carry look ahead depends on two things :
  - a. Calculating for each digit position whether that position is going to propagate a carry if one comes in from the right.
  - b. Combining these calculated values to be able to deduce quickly whether, for each group of digits, that group is going to propagate a carry that comes in from the right.

5. Carry look ahead logic uses the concepts of generating and propagating carries.
6. The addition of two binary numbers in parallel implies that all the bits of the augend and addend are available for computation at the same time.
7. The carry propagation time is an important attribute of the adder because it limits the speed with which two numbers are added.

8. A solution is to increase the complexity of the equipment in such a way that the carry delay time is reduced.

**Fig. 2.2.1.**

9. Consider the circuit of the full adder shown in Fig. 2.2.1. If we define two new binary variables,

$$P_i = A_i \oplus B_i, \quad G_i = A_i B_i$$

10. The output sum and carry can respectively be expressed as

$$S_i = P_i \oplus C_i, \quad C_{i+1} = G_i + P_i C_i$$

11.  $G_i$  is called a carry generate, and it produces a carry of 1 when both  $A_i$  and  $B_i$  are 1, regardless of the input carry  $C_i$ .  $P_i$  is called a carry propagate, because it determines whether a carry into stage  $i+1$  will propagate into stage  $i+1$ .

$$C_0 = \text{input carry}$$

$$C_1 = G_0 + P_0 C_0$$

$$C_2 = G_1 + P_1 C_1 = G_1 + P_1 (G_0 + P_0 C_0)$$

$$= G_1 + P_1 G_0 + P_1 P_0 C_0$$

$$C_3 = G_2 + P_2 C_2 = G_2 + P_2 G_1 + P_2 P_1 G_0 + P_2 P_1 P_0 C_0$$

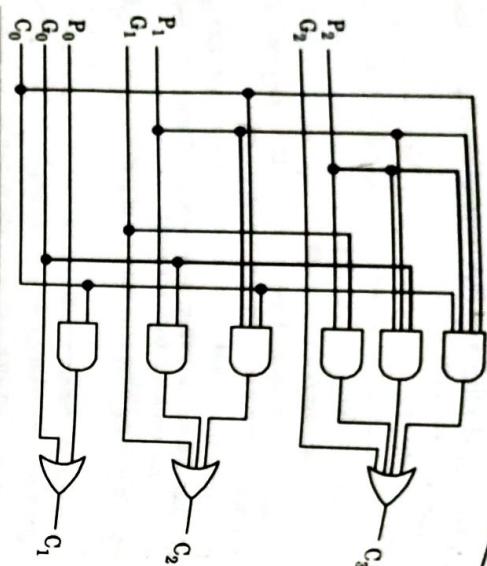

Fig. 2.1.2. Logic diagram of carry look ahead generator.

**PART-2**

**Multiplication : Signed Operand Multiplication, Booth's Algorithm and Array Multipliers.**

Questions-Answers
Long Answer Type and Medium Answer Type Questions

**Que 2.2.** Explain the Booth's algorithm in depth with the help of flowchart. Give an example for multiplication using Booth's algorithm.

**AKTU 2016-17, Marks 15**

**Discuss the Booth's algorithm for 2's complement number. Also illustrate it with the some example.**

**Explain Booth's multiplication algorithm in detail.**

**AKTU 2017-18, Marks 07**

**Answer**

The algorithm for 2's complement multiplication is as follows :

- Step 1 :** Load multiplicand in  $B$ , multiplier in  $Q$ . For negative numbers,  $Z_8$  complement format to be used.  
**Step 2 :** Initialize the down counter CR by the number of bits involved.  
**Step 3 :** Clean locations  $A$  ( $n$ -bits) and  $Q_{n+1}$  (1-bit).  
**Step 4 :** Check LS bit of  $Q_n$  and  $Q_{n+1}$  jointly. If the pattern is 00 or 11 then go to Step 5. If 10, then  $A = A - B$ . If 01, then  $A = A + B$ .  
**Step 5 :** Perform arithmetic right-shift with  $A$ ,  $Q_n$  and  $Q_{n+1}$ . LS of  $A$  goes to MS of  $Q_n$  and LS of  $Q$  goes to  $Q_{n+1}$ . Old content of  $Q_{n+1}$  is discarded.  
**Step 6 :** Decrement CR by one. If CR is not zero then go to Step 4.  
**Step 7 :** Final result (or the product) is available in  $A$  (higher part) and  $Q_n$  (lower part).

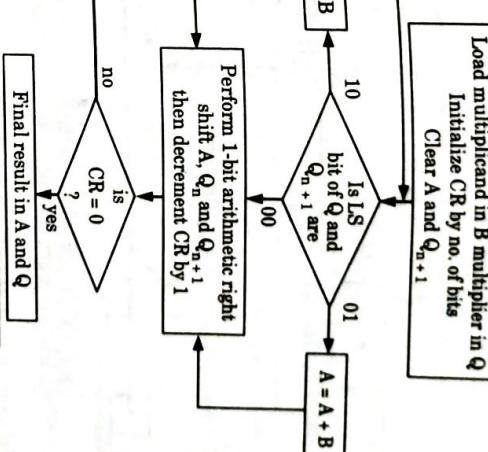

Fig. 2.3.1. 2's Complement multiplication.

**Example :** Both negative ( $-5 \times -4$ )

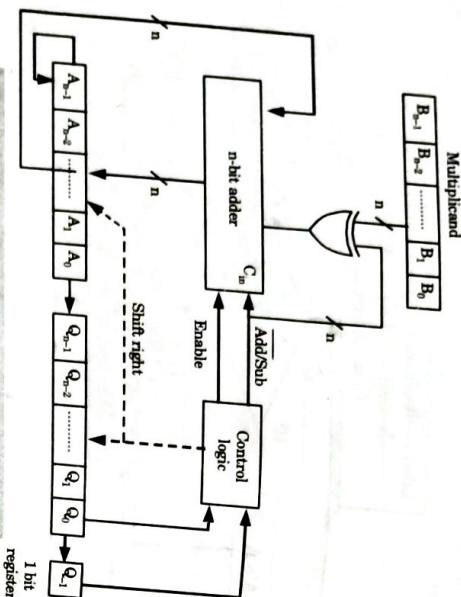

**Multiplicand ( $B$ )  $\leftarrow 1011(-5)$  Multiplier ( $Q$ )  $\leftarrow 1100(-4)$**

Multiplicand ( $B$ )	$A$	$Q_n$	$Q_{n+1}$	Operation	CR
				Initial	4
0 0 0 0	1 1 0 0	0			
0 0 0 0	0 1 1 0	0		Shift right	3
0 0 0 0	0 0 1 1	0		Shift right	2
0 1 0 1	0 0 1 1	0		$A \leftarrow A - B$	1
0 0 1 0	1 0 0 1	1		Shift right	0
0 0 0 1	0 1 0 0	1		Shift right	0
Result :	0 0 0 1	.0 1 0 0		= + 20	

**Que 24.** Explain Booth's algorithm with its hardware implementation.

**Answer**

- Fig. 2.4.1 shows the hardware implementation for Booth's algorithm.
- The circuit is similar to the circuit for positive number multiplication.
- It consists of an  $n$ -bit adder, control logic and four register  $A, B, Q_{-1}$  and  $Q_{-1}$ .

**Fig. 2.4.1.** Hardware implementation of signed binary multiplication for Booth's algorithm.

- Multiplicand and multiplicand are loaded into register  $Q$  and register  $B$  respectively.

- Register  $A$  and  $Q_{-1}$  are initially set to 0.
- The  $n$ -bit adder performs addition, input of adders comes from multiplicand and content of register  $A$ .

- In case of addition,  $\overline{\text{Add}}$  / Sub line is 0, therefore,  $C_{in} = 0$  and multiplicand is directly applied as a second input to the  $n$ -bit adder.
- In case of subtraction,  $\overline{\text{Add}}$  / Sub line is 1, therefore  $C_{in} = 1$  and multiplicand is complemented and then applied to the  $n$ -bit adder. As a result, the 2's complement of the multiplicand is added to the content of register  $A$ .

- The control logic scans bit  $Q_0$  and  $Q_{-1}$  one at a time and generates the control signals to perform the corresponding function.
- If the two bits are same (1 - 1 or 0 - 0), then all the bits of  $A, Q$  and  $Q_{-1}$  register are shifted to right 1 bit without addition or subtraction ( $\text{Add/Subtract Enable} = 0$ ).

Computer Organization & Architecture  
Unit-2  
1. If the two bits differ, then the multiplicand is added to or subtracted from the  $A$  register, depending on the status of bits.  
2. After addition or subtraction right shift occurs such that the left most bit of  $A (A_{n-1})$  is not only shifted into  $A_{n-2}$  but also remains in  $A_{n-1}$ . This is required to preserve the sign of the number in  $A$  and  $Q$ .

- Que 25.** Draw the data path of 2's compliment multiplier. Give the Robertson multiplication algorithm for 2's compliment fractions. Also illustrate the algorithm for 2's compliment fraction by a suitable example.

**Answer**

**Datapath of 2's compliment multiplier:** Refer Q. 2.3, Page 2-4B,

**Unit-2.**  
**Robertson algorithm :**

- $A \leftarrow 0, B \leftarrow \text{Multiplicand}$   $Q \leftarrow \text{Multiplier}$  and count  $\leftarrow n$ .
- If  $Q_0 = 1$  then perform  $A \leftarrow A + B$ .
- Shift right register  $F.A.Q$  by 1 bit  $F \leftarrow B [n-1]$  AND  $Q[0]$  OR  $F$  and count  $\leftarrow$  count - 1.
- If count  $> 1$  Repeat steps 2 and 3, otherwise if  $Q_0 = 1$  then perform  $A \leftarrow A - B$  and set  $Q[0] = 0$ .

For example : We perform the multiplication of fraction as :

$$\text{Multiplier} = 0.625$$

Equivalent binary representation  $0.625 = 0101$

$2^3$ 's complement representation  $-0.625 = 1010 + 1(-0.625) = 1011$

Equivalent binary representation  $+0.5 = 0100$   
2 complement representation  $-0.5 = 1011 + 1 - 0.5 = 1100$

	0 1 0 1	B
F		
A	0 0 0 0	0 1 0 0
Q	0 0 0 0	0 1 0 0
Steps		
Step 1	0 0 0 0	0 0 1 0
		Q <sub>0</sub> = 0, No need addition
		1 bit right shift
Step 2	0 0 0 0	0 0 1 0
		Q <sub>0</sub> = 0, No need addition
		1 bit right shift
Step 3	0 0 0 1	0 0 0 1
		Q <sub>0</sub> = 1, A $\leftarrow A + B$
		1 bit right shift
Step 4	0 0 1 0	1 0 0 0
		Q <sub>0</sub> = 0, No need addition
Final		Final product
		$0.625 \times 0.5 = 0.3125$
		$0101 \times 0100 = 00101000$

ANNU 2017-18, March-07

**Ques 14.** Show step by step the multiplication process using Booth's algorithm when (+ 15) and (- 13) numbers are multiplied.

Assume 5-bit registers that hold signed numbers.

**AKTU 2014-15, Marks 10**

**Answer**  
 $15 = 01111$   
 $-13 = 2^5 \text{ complement of } 13 = 10011$

Multiplicand (M) = 01111, Multiplier = 10011

A	$Q_n$	$Q_{n+1}$	Operation	SC
00000	10011	0		101 (5)
10001	10011	0	$A \leftarrow A - M$	
11000	11001	1	Shift	100 (4)
11100	01100	1	Shift	011 (3)
01011	01100	1	$A \leftarrow A + M$	
00101	10110	0	Shift	010 (2)
00010	11011	0	Shift	001 (1)
10011	11011	0	$A \leftarrow A - M$	
11001	11101	1	Shift	000 (0)
Result = (11001	11101	= -195 (2's complement of +195)		

**Ques 2.7.** Show the contents of the registers E, A, Q, SC during the process of multiplication of two binary numbers 11111 (multiplicand) 10101 (multiplier). The signs are not included.

**AKTU 2016-17, Marks 10**

**Ques 2.9.** Draw the flowchart of Booth's algorithm for multiplication and show the multiplication process using Booth's algorithm for  $(-7) \times (+3)$ .

**AKTU 2016-17, Marks 07**

Multiplicand B = 11111	E	A	$Q_n$	SC
$Q_n = 1$ ; add B	0	00000	10101	101

$Q_n = 1$ ; add B	E	A	$Q_n$	SC
Shift right EAQ	0	00000	11111	
$Q_n = 1$ ; add B		01111	11111	
Shift right EAQ	0	01111	00000	
$Q_n = 0$ ; shift right EAQ	0	00000	00011	001
$Q_n = 0$ ; shift right EAQ	0	00000	00001	000

**Ques 2.8.** Show the multiplication process using Booth's algorithm when the following numbers are multiplied:  $(-13)$  by  $(+8)$

**AKTU 2016-17, Marks 07**

**Answer**  
 $True \text{ binary equivalent of } +8 = 01000$   
 $1's \text{ complement of } +13 = 01101$   
 $+1$   
 $2^5 \text{ complement of } +13 = \underline{\underline{10011}} \quad (-13)$

Multiplicand (B) = 10011

Multiplier = 01000

A	$Q_n$	$Q_{n+1}$	Operation	SC
00000	01000	0		100
00000	00100	0	Ashr $AQQ_{n+1}$	
00000	00010	0	Ashr $AQQ_{n+1}$	011
00000	00001	0	Ashr $AQQ_{n+1}$	010
01101	00001	0	Add $\bar{B} + 1$ to A	001
00110	10000	1	Add B to A Ashr $AQQ_{n+1}$	000
11100	11000	0	Add B to A Ashr $AQQ_{n+1}$	

Result: 11100 11000 = -104 (2's complement of (+104))

**Answer**  
Flowchart of Booth's algorithm for multiplication : Refer Q. 2.3.  
Page 2-4B, Unit-2.

**Multiplication:** Multiply  $(-7) \times (+3)$   
Convert  $(-7)$  into 2's complement form:

$$+7 = 0111$$

$$1's \text{ complement of } (+7) = 1000$$

$$\text{adding } 1 = 1001$$

$$2^5 \text{ complement of } (+7) = \underline{\underline{1001}}$$

$$(+3) = 0011$$

## 2-10 B (CSIT-Sem-3)

			<b>00</b>

Answer is 11101011

( $-7 \times (+3) = -21 = 11101011$  (2's complement of +21))

**Que 2.10.** Explain array multiplier method with the help of example.

### Answer

1. The combinational circuit implemented to perform multiplication is called array multiplier.

2. The generalized multiplication process for array multiplier for two unsigned integers : Multiplicand  $A = A_3A_2A_1A_0$  and multiplier  $B = B_3B_2B_1B_0$  is shown in Fig. 2.10.1.

**Fig. 2.10.1. Manual multiplication process.**

$$A = A_3 A_2 A_1 A_0$$

$$+ B_3 B_2 B_1 B_0$$

$$A_3 B_0 \quad A_2 B_0 \quad A_1 B_0 \quad A_0 B_0 \quad \text{PP0}$$

$$A_3 B_1 \quad A_2 B_1 \quad A_1 B_1 \quad A_0 B_1 \quad \text{PP1}$$

$$A_3 B_2 \quad A_2 B_2 \quad A_1 B_2 \quad A_0 B_2 \quad \text{PP2}$$

$$A_3 B_3 \quad A_2 B_3 \quad A_1 B_3 \quad A_0 B_3 \quad \text{PP3}$$

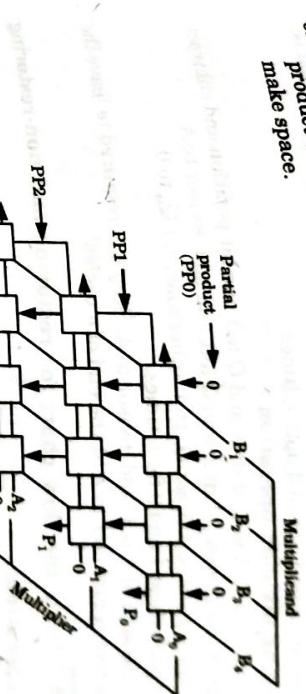

$$P_7 \quad P_6 \quad P_5 \quad P_4 \quad P_3 \quad P_2 \quad P_1 \quad P_0 \quad \text{PP4}$$

### Computer Organization & Architecture

$$\begin{aligned} P_2 &= A_2 B_0 + A_1 B_1 + A_0 B_2 \\ P_3 &= A_3 B_0 + A_2 B_1 + A_1 B_2 + A_0 B_3 \\ P_4 &= A_3 B_1 + A_2 B_2 + A_1 B_3 \\ P_5 &= A_3 B_2 + A_2 B_3 \\ P_6 &= A_3 B_3 \end{aligned}$$

5. The product component bit is a logical AND of multiplier bit  $B_i$  and multiplicand bit  $A_j$ , i.e.,  $B_i \times A_j$ . Since the arithmetic and logic products coincide in the 1 bit case.

6. Fig. 2.10.2 shows the circuit to add the product components. Here, the product components are represented by AND gates and separated to make space.

**Fig. 2.10.2. Block diagram of combinational multiplier.**

7. The full adder block is represented by square block. The carries in each partial product row of full adders are connected to make 4-bit ripple adder.  
8. Thus, the first 4-bit ripple adder adds the first two rows of product components to produce the first partial product.  
9. The carry output generated is propagated to the most significant product component used to produce the next partial product.  
10. The subsequent adders add each partial product with the next product component.

### PART-3

#### Division and Logic Operations.

3. Each shifted multiplicand which is multiplied by either 0 or 1 depending on the corresponding multiplier bit is called Partial Product (PP).  
4. Each partial product consists of four product components.

$$P_0 = A_0 B_0$$

$$P_1 = A_1 B_0 + A_0 B_1$$

### 2-11 B (CMT-Sem-3)

**Ques 2.11.** Write down the step for restoring and non-restoring division operations.

**Answer**

**Restoring division operation :**

Step 1 : Shift A and Q left one binary position.

Step 2 : Subtract divisor from A and place answer back in A ( $A \leftarrow A - B$ ).

Step 3 : If the sign bit of A is 1, set  $Q_0$  to 0 and add divisor back to A (that is, restore A); otherwise, set  $Q_0$  to 1.

Step 4 : Repeat steps 1, 2 and 3 upto  $n$  times.

**Non-restoring division operation :**

Step 1 : If the sign of A is 0, shift A and Q left one bit position and subtract divisor from A; otherwise, shift A and Q left and add divisor to A.

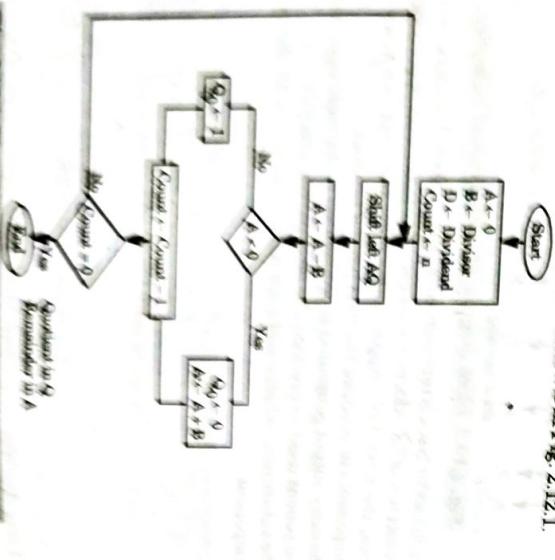

Step 3 : Repeat steps 1 and 2 for  $n$  times.

Step 4 : If the sign of A is 1, add divisor to A. Step 4 is required to leave the proper positive remainder in A at the end of  $n$  cycles.

**Ques 2.12.** Draw the flow chart for restoring and non-restoring division operation.

**Answer**

Flowchart for restoring division operation is shown in Fig. 2.12.1.

Computer Organization & Architecture  
A flow chart for non-restoring division operation is shown in Fig. 2.12.2.

Start

$A \leftarrow 0$   
 $B \leftarrow \text{Divisor}$   
 $D \leftarrow \text{Dividend}$   
 $\text{Count} \leftarrow n$

$A \leftarrow A - B$   
 $Q_0 \leftarrow 1$

$A \leftarrow A + B$   
 $Q_0 \leftarrow 0$

$\text{Count} \leftarrow \text{Count} - 1$

No  
 $\text{Count} = 0$

Yes  
 $A < 0$

Yes  
 $A < 0$

Quotient in Q  
Remainder in A

**Fig. 2.12.1/2. Flow chart for non-restoring division operation.**

**Ques 2.13.** Draw the data path of sequential  $n$ -bit binary divider. Give the non-restoring division algorithm for unsigned integers. Also illustrate algorithm for unsigned integer with a suitable example.

ANU 2017-18, Mat-07

**Answer** Datapath of sequential  $n$ -bit binary divider:

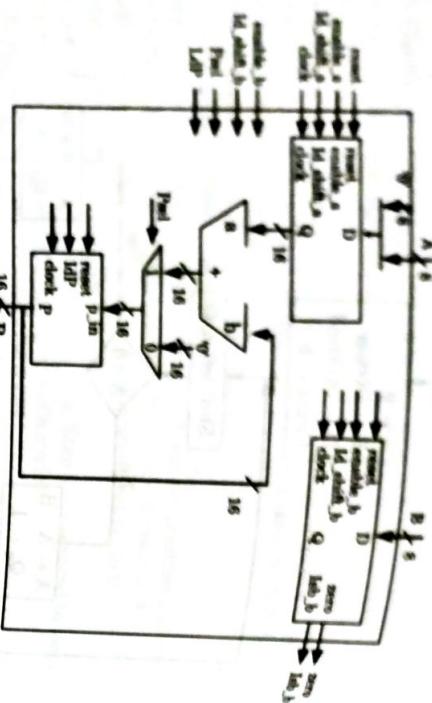

Fig. 2.18.1.

**Algorithm for non-restoring division :** Refer Q. 2.11, Page 2-12B.  
Unit-2.

For example, consider 4-bit dividend and 2-bit divisor:

Dividend = 1010, Divisor = 0011.

A Register	Q Register	
Initially 0 0 0 0	1 0 1 0	Dividend
Shift 0 0 0 0	0 1 0 □	
Subtract 1 1 0 1	1 1 1 0	
set $Q_0$ 1 1 1 0	1 0 1 0	
Shift 1 1 1 0	1 0 □ □	
Add 0 0 0 1	1 0 0 0	
set $Q_0$ 1 1 1 1	1 0 0 0	
Shift 1 1 1 1	0 0 0 0	
Add 0 0 0 1	0 0 0 0	
set $Q_0$ 0 0 0 1	0 0 0 0	

Second Cycle

Third Cycle

Fourth Cycle

Remainder Quotient

**Answer** What do you mean by overflow? Describe the overflow detection.

**Overflow:** Overflow is a condition when two numbers with  $n$  digits are added and the sum is a number occupying  $n+1$  digit.

- Overflow is a problem in digital computer because the number of bits cannot be accommodated by an  $n$ -bit word.
- Overflow is a problem of integer overflow.
- There are following three types of overflow:
  - Positive overflow :** Positive overflow refers to a number that is larger than that can be represented in a given number of bits.

Computer Organization & Architecture  
In given example after 4 cycles register A is positive and hence step 3 is not required.

**Que 2.14.** Perform the division process of 00001111 by 0011 (use a dividend of 8 bits).

**Answer**

B = 0011	$\bar{B} + 1 = 1101$	E	A	Q	SC
		0	0000	1111	1110
			0001	1110	100
		0	1110	1110	
			0011	011	
		1	0001	1100	
			1101		
		0	0000	1101	010
			1101		
		0	0001	1010	001
			1110		
		0	0011	0001	
			0001		
		1	0001	0100	
			0000		
		0	0011	0100	000
			1101		
		0	0000	0101	Quotient
			0000		

**Answer**

- ii. **Exponent overflow :** Exponent overflow refers to floating point representations and refers to a positive exponent that exceeds the maximum possible exponent value.

- iii. **Significand overflow :** Significand overflow occurs when the addition of two significant numbers of the same sign results in a carry out of the most significant bit.

**Overflow detection :** An overflow can be detected by observing the carry into the sign bit position. If these two carries are not equal, an overflow condition is produced.

For example:

$$\begin{array}{r} +35 \quad 0 \quad 100011 \quad -35 \quad 1 \quad 011101 \\ +40 \quad 0 \quad 101000 \quad -40 \quad 1 \quad 011000 \\ \hline 75 \quad 1 \quad 001011 \quad -75 \quad 10 \quad 110101 \end{array}$$

Two carries are explicitly shown. If the two carries are applied to an exclusive OR gate, an overflow would be detected when the output of the gate is 1.

#### PART-4

#### Floating Point Arithmetic Operations, Arithmetic and Logic Unit Design.

##### Questions-Answers

##### Long Answer Type and Medium Answer Type Questions

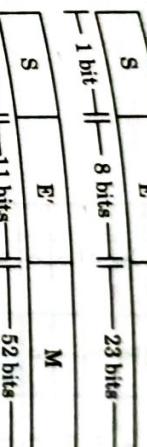

##### Que 2.16. Explain the basic format used to represent floating point numbers.

**Answer**

The floating point representation has three fields:

1. **The sign bit :** The sign bit determines whether the number is negative or positive. 0 denotes a positive number and 1 denotes a negative number.
2. **The exponent :** The exponent field needs to represent both positive and negative exponents. To do this, a bias is added to the actual exponent in order to get the stored exponent. For IEEE single precision precision, the exponent field is of 8 bits and has a bias value of 127. For double precision, the exponent field is of 11 bits, and has a bias of 1023.
3. **The mantissa :** The mantissa, also known as the significand, represents the precision bits of the number. It is composed of an implicit leading bit and the fraction bits.

Computer Organization & Architecture			2-17B (CSE/T-Sem 3)			
The general structure of floating point number is						
<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="padding: 5px;">S</td> <td style="padding: 5px;">E'</td> <td style="padding: 5px;">M</td> </tr> </table>	S	E'	M	Single precision		
S	E'	M				

Where S is significant (mantissa) digits, E is exponent, B is scaling factor, which is 2 for binary number, 10 for decimal number.

- Que 2.17.** Write the steps for various floating point arithmetic operations.

**Answer**

Steps for various floating point arithmetic operations are :

Steps for addition and subtraction :

- i. Step 1: Check for zeros.

- Step 2: Align the mantissas.

- Step 3: Add or subtract the mantissas.

- Step 4: Normalize the result.

**ii. Multiplication :**

- Step 1: Check for zeros.

- Step 2: Add the exponents.

- Step 3: Multiply the mantissas and determine the sign of the result.

- Step 4: Normalize the product.

**iii. Division :**

- Step 1: Check for zeros.

- Step 2: Subtract the exponents.

- Step 3: Divide the mantissas and determine the sign of the result.

- Step 4: Normalize the result.

- Que 2.18.** Explain the function of arithmetic circuit with the help of circuit diagram.

##### Answer

Arithmetic circuit performs the operation of both addition and subtraction. It has two 4-bit inputs  $A_3 A_2 A_1 A_0$  and  $B_3 B_2 B_1 B_0$ .

**4-bit parallel adder/subtractor :** It is an arithmetic circuit.

1. The ADD/SUB control line, connected with  $C_{in}$  of the full adder, is used to perform the operations of addition and subtraction.
2. The EXOR gates are used as controlled inverters.

Fig. 2.18.1. Symbol of EXOR gate.

Table 2-18.1. Truth table of EXOR Gate.

Input		
C	X	Y
0	0	0
0	1	1
1	0	1
1	1	0

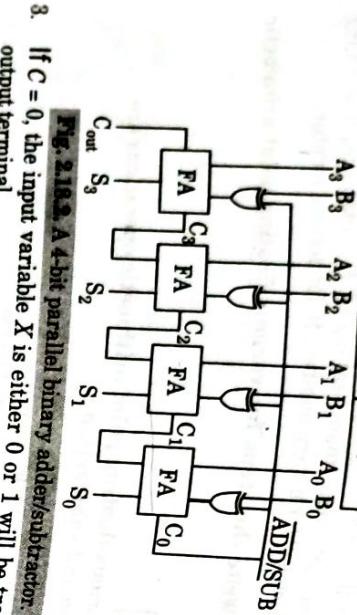

Fig 2-18.3 A 4-bit parallel binary adder/subtractor.

3. If  $C = 0$ , the input variable  $X$  is either 0 or 1 will be transferred to output terminal.

4. If  $C = 1$ , the input variable  $X$  is either 0 or 1 will be transferred to output. By using this EXOR gate property we use this

- Case 1 : ADD/SUB = 1
- i. Now, the controlled inverter (EXOR gate) produces the 1's complement of  $B_3, B_2, B_1, B_0$ . Since 1 is given to  $C_{in}$  of the LSB bit of the adder, it is added to the complemented output of EXOR gate output, it is equal to 2's complement of  $B_3, B_2, B_1, B_0$ .

- ii. The 2's complemented  $B_3, B_2, B_1, B_0$  will be added to  $A_3, A_2, A_1, A_0$  to produce the sum, the produced output of  $S_3, S_2, S_1, S_0$  is the difference between  $A_3, A_2, A_1, A_0$  and  $B_3, B_2, B_1, B_0$ .

- Case 2 : ADD/SUB = 0.
- i. Now, the controlled inverter is transferred  $B_3, B_2, B_1, B_0$  four bit to full adder, this 4 bit is added with  $A_3, A_2, A_1, A_0$  to produce sum and carry.

- Ques 2-18. Add -35 and -31 in binary using 8-bit registers, in signed 1's complement and signed 2's complement.

**Answer**

sign bit

True binary number of	35 =	0 0 1 0 0 0 1 1
True binary number of	31 =	0 0 0 1 1 1 1 1

**AKTU 2014-15, Marks 05**

- Ques 2-20. Draw the block diagram of control unit of basic computer. Explain in detail with control timing diagrams.

**AKTU 2016-17, Marks 10****Answer**

- The control unit consists of 2 decoders, 1 sequence counter, number of control logic gates.
- The instruction in IR is divided into 3 parts : 15th bit to a flip-flop (FF) called I, Operation code, and bits 0 to 11. The Op-code is decoded using 3\*8 decoder ( $D_0$  to  $D_7$ ). Bits 0 to 11 are applied to the control signals output of a 4-bit sequence counter. The output of the clock. Initially CLR / P ( $T_0$  to  $T_{15}$ ).
- The SC responds to the positive transition of the clock. Initially  $T_0$  is active as the output of the decoder. This in turn triggers those registers whose control is active, in 1st positive transition of the clock.  $T_0$  is incremented and the timing signals  $T_0$  to  $T_{15}$  are created. This continues unless SC is cleared. We can clear the SC with decoder output  $D_3$  active, denoted as :  $D_3, T_4 : SC \leftarrow 0$

### 2-20 B (CSIT-Sem-3)

**Fig. 2-20.1** Block diagram of control unit.

4.

Output  $D_3$  from the operation decoder becomes active.

When  $T_4$  is active, the output of AND gate that implements the control function  $D_3 T_4$  becomes active. This signal is applied to CLR input of SC.

Example of register transfer :  $T_0 : AR \leftarrow PC$  (Activities in  $T_0$  will be

content of PC placed on bus,  $S_2 S_1 S_0 = 010$ , LD of AR is active, transfer

occurs at the end of positive transition,  $T_0$  is inactive,  $T_1$  gets active).

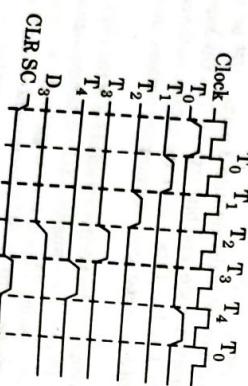

The SC can be incremented or cleared.  $T_0, T_1, T_2, T_3, T_4, T_0, \dots$

For example :

Assume : At time  $T_4$ , SC is cleared to 0 if decoder output  $D_3$  is active.

Timing diagram :

$$D_3 T_4 : SC \leftarrow 0$$

**Fig. 2-20.2**

point binary numbers where negative numbers are signed 1's complement presentation.

### 2-21 B (CSIT-Sem-3)

**Fig. 2-21.1**

### PART-5

#### IEEE Standard for Floating Point Numbers.

Questions-Answers

Long Answer Type and Medium Answer Type Questions

Que 2-21. Explain IEEE standard for floating point numbers.

OR

How floating point numbers are represented in computer, also give IEEE 754 standard 32-bit floating point number format.

AKTU 2017-18, Marks 07

## Arithmetic and Logic Unit

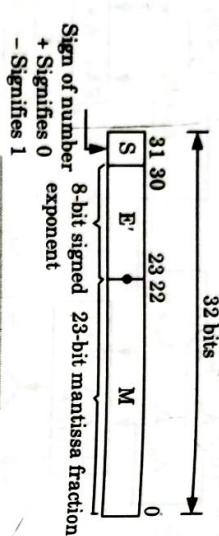

Represent  $1460.125_{10}$  in single precision and double precision formats.

**Answer**

- The IEEE standard for floating point arithmetic (IEEE 754) is a technical standard for floating point computation.
- IEEE 754 numbers are divided into two types :

**a. Single precision :**

- The floating point numbers in 32-bit are single precision.

**Fig. 2.22.1. Single precision.**

- 32-bit floating point number in single precision is represented as  $+1M \times 2^E$ .
- The relationship between  $E$  and  $E'$  in single precision is given as  $E' = E + 127$ .
- The 8-bit assigned for exponent  $E'$  (Modified exponent) is in the range  $0 < E' < 255$  for normal values. Thus the actual exponent is in the range  $-127 \leq E \leq 127$ .
- The values 0 and 255 are used to indicates the floating points values of exact 0 and infinite respectively.

**b. Double precision :**

- The floating number in 64-bit are double precision. Fig. 2.22.2 show the double precision format of IEEE standard form.
- The double precision format has increased, exponent and mantissa ranges.
- The 11 bit assigned for exponent  $E'$  has range  $0 < E' < 2047$  for normal values. Thus the actual exponent  $E$  is in the range  $1022 \leq E \leq 1023$ . The relationship between  $E$  and  $E'$  in double precision is given as  $E' = E + 1023$ .
- The 52 bit is assigned for mantissa, provides a precision equivalent to about 16 decimal digits.
- 64-bit floating point number in double precision is represented as  $\pm 1.M \times 2^E$ .

**Fig. 2.22.2. Double precision.**

**Step 1 : Convert the decimal number in binary format.**

For integer,

2	1460	0
2	730	0
2	365	1
2	182	0
2	91	1
2	45	1
2	22	0
2	11	1
2	5	1
2	2	0
	1	

$(1460)_{10} = (10110110100)_2$

For fraction,

$$\begin{aligned} 0.125 \times 2 &= 0.250 \Rightarrow 0 \\ 0.250 \times 2 &= 0.500 \Rightarrow 0 \\ 0.500 \times 2 &= 1.000 \Rightarrow 1 \\ (0.125)^{10} &= (0.001)_2 \\ (1460.125)^{10} &= (10110110100.001)_2 \end{aligned}$$

**Step 2 : Normalize the number.**

$$10110110100.001 = 1.011011010001 \times 2^{10}$$

**Single precision :**

For a given floating point number,

$$1.011011010001 \times 2^{10}$$

$$S = 0$$

$$E = 10$$

$$M = 011011010001$$

$$\begin{aligned} \text{Bias (or) modified exponent for single precision} \\ E' &= 127 + E \\ &= 127 + 10 = 137_{10} \\ &= 10001001_2 \end{aligned}$$

Number is single precision format

0	10001001	0110110100001.....0
---	----------	---------------------

**Double precision :**

For a given number,

$$1.011011010001 \times 2^{10}$$

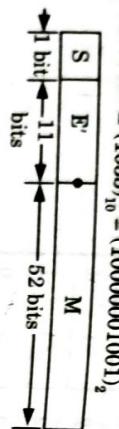

$$S = 0, E = 10, M = 0110110100001$$

Bias (or) modified exponent for double precision

$$E' = E + 1023$$

$$= 10 + 1023$$

$$= (1033)_{10} = (10000001001)_2$$

### VERY IMPORTANT QUESTIONS

*Following questions are very important. These questions may be asked in your SESSIONALS as well as UNIVERSITY EXAMINATION.*

- Q. 1. Describe sequential Arithmetic and Logic Unit (ALU) using proper diagram.
- Ans:** Refer Q. 2.1.
- Q. 2. Explain Booth's multiplication algorithm in detail.
- Ans:** Refer Q. 2.3.
- Q. 3. Draw the data path of 2's compliment multiplier. Give the Robertson multiplication algorithm for 2's compliment fractions. Also illustrate the algorithm for 2's compliment fraction by a suitable example.
- Ans:** Refer Q. 2.5.
- Q. 4. Show step by step the multiplication process using Booth's algorithm when (+ 15) and (- 13) numbers are multiplied. Assume 5-bit registers that hold signed numbers.
- Ans:** Refer Q. 2.6.

- Q. 5. Show the contents of the registers E, A, Q, SC during the process of multiplication of two binary numbers 11111 and 10101 (multiplicand) 10101 (multiplier). The signs are not included.

Refer Q. 2.7.

- Q. 6. Show the multiplication process using Booth's algorithm when the following numbers are multiplied : (- 13) by (+ 8) when the following numbers are multiplied : (- 13) by (+ 8)

Refer Q. 2.8.

- Q. 7. Draw the flowchart of Booth's algorithm for multiplication and show the multiplication process using Booth's algorithm for (- 7)  $\times$  (+ 3).

Refer Q. 2.9.

- Q. 8. Draw the data path of sequential n-bit binary divider. Give the non-restoring division algorithm for unsigned integer with a suitable example.

Also illustrate algorithm for unsigned integer with a suitable example.

Refer Q. 2.13.

- Q. 9. Perform the division process of 00001111 by 0011 (use a dividend of 8 bits).

**Ans:** Refer Q. 2.14.

- Q. 10. Add - 35 and - 31 in binary using 8-bit registers, in signed 1's complement and signed 2's complement.

**Ans:** Refer Q. 2.19.

- Q. 11. Draw the block diagram of control unit of basic computer. Explain in detail with control timing diagrams.

**Ans:** Refer Q. 2.20.

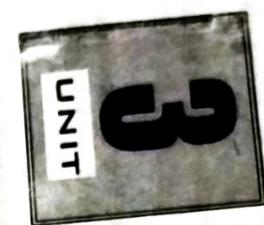

- Q. 12. Draw a flowchart for adding and subtracting two fixed point binary numbers where negative numbers are signed 1's complement presentation.

**Ans:** Refer Q. 2.21.

- Q. 13. How floating point numbers are represented in computer, also give IEEE 754 standard 32-bit floating point number format.

**Ans:** Refer Q. 2.22.

**Que 3.1.** What is an instruction in the context of computer organization ? Explain the purpose of the various elements of an instruction with the help of a sample instruction format.

**AKTU 2014-15, Marks 10**

#### Answer

##### Instruction :

1. Instruction is a command to the processor to perform a given task on specified data.
2. An instruction is a designed binary pattern which is based on the architecture of CPU to perform a specific function. The entire group of instructions is called the instruction set.

##### Instruction format :

Opcode	Operand
--------	---------

**Fig. 3.1.1.**

Instruction has two parts opcode and operand,

1. Task to be performed, called the operation code (Opcode), and the data to be operated upon, called the operand.
2. The operands include the input data of the operation and the results that are produced.
3. A computer must have instructions capable of performing four types of operations :
  - Data transfers between the memory and the CPU registers.
  - Arithmetic and logic operations on data.
  - Program sequencing and control.
  - I/O transfers.
4. The purpose of an instruction is to specify both an operation to be carried out by a CPU or also process the set of operands or data to be used in the operation.

**Example :**

This instruction will multiply two operand A and B and result is stored in A.

**Ques 3.2.** Describe the types of instructions on the basis of address fields used in the instruction with example.

**Answer**

Four types of instructions are available on the basis of referenced address fields:  
Now, Let us evaluate the following arithmetic expression, using all instruction types.

$$X = (A + B) * (C + D)$$

1. **Three address instruction :** Computers with three address instruction formats can use each address fields to specify either a processor register or a memory operand. The program in assembly language to evaluate arithmetic expression is shown as:

```
ADD R1, A, B      R1 ← M[A] + M[B]
ADD R2, C, D      R2 ← M[C] + M[D]
MUL X, R1, R2     M[X] ← R1 * R2
```

2. **Two address instruction :** In this format each address field can specify either a processor register or a memory word. The assembly language program to evaluate arithmetic expression is as follows:

```
MOV R1, A          R1 ← M[A]
ADD R1, B          R1 ← R1 + M[B]
MOV R2, C          R2 ← M[C]
ADD R2, D          R2 ← R2 + M[D]
MUL R1, R2         R1 ← R1 * R2
MOV X, R1           M[X] ← R1
```

3. **One address instruction :** One address instruction uses an implied accumulator(AC) register for all data manipulation. The program is as follows:

```
LOAD A             AC ← M[A]
```

```
ADD B             AC ← AC + M[B]
```

```
STORE T           M[T] ← AC
```

```
LOAD C             AC ← M[C]
```

```
ADD D             AC ← AC + M[D]
```

```
MUL T             AC ← AC * M[T]
```

```
STORE X           M[X] ← AC
```

All operations are done between the AC register and a memory operand an address field for the instructions ADD and MUL. The PUSH and POP instructions need an address field to specify the operand that communicates with the stack. The program is as follows :

```
PUSH A            TOS ← A
```

```
PUSH B            TOS ← B
```

```
ADD TOS ← (A + B)
```

```
PUSH C
```

```
TOS ← C
```

PUSH	D	TOS ← D
ADD		TOS ← (C + D)
MUL	X	M[X] ← TOS
POP		

where TOS is TOP of the stack.

**Ques 3.3.** Evaluate the arithmetic statement  $X = (A + B)*(C + D)$  using a general register computer with three address, two address and one address instruction format a program to evaluate the expression.

**Answer**

Three address instruction :

```
ADD R1, A, B      R1 ← M[A] + M[B]
ADD R2, C, D      R2 ← M[C] + M[D]
MUL X, R1, R2     M[X] ← R1 * R2
```

Two address instruction :

```
MOV R1, A          R1 ← M[A]
ADD R1, B          R1 ← R1 + M[B]
MOV R2, C          R2 ← M[C]
ADD R2, D          R2 ← R2 + M[D]
MUL R1, R2         R1 ← R1 * R2
MOV X, R1           M[X] ← R1
```

One address instruction :

```
LOAD A             AC ← M[A]
ADD B             AC ← AC + M[B]
STORE T           M[T] ← AC
LOAD C             AC ← M[C]
ADD D             AC ← AC + M[D]
MUL T             AC ← AC * M[T]
STORE X           M[X] ← AC
```

## PART-2

Instruction Cycle and Sub Cycle (Fetch and Execute etc.).

### Questions-Answers

Long Answer Type and Medium Answer Type Questions

**Ques 3.4.** Define instruction cycle and divide instruction cycle into sub cycles with the help of diagram, explain the sequence in which sub cycles are executed.

OR

**Explain the different cycles of an instruction execution.**

OR

**Explain all the phases of instruction cycle.**

**AKTU 2018-19, Marks 3.5****Answer****Instruction cycle :**

1. Instruction cycle is a complete process of instruction execution.
2. It is a basic operational process of a computer.
3. It is the process by which a computer retrieves a program instruction from its memory, determines what actions the instruction dictates, and carries out those actions.

**The instruction cycle is divided into three sub cycles :**

**Fig. 34.1.****1. Fetch cycle :**

steps are performed :

- i. The program counter places the address of the memory location in which the opcode is stored, on the address bus.
- ii. The CPU sends the required memory control signals so as to enable the memory to send the opcode.
- iii. The opcode stored in the memory location is placed on the data bus and transferred to the CPU.

**2. Decode cycle :**

- i. The opcode which is fetched from the memory is placed first of all in the Data Register (DR) (data/address buffer in case of Intel 8085). Thereafter it goes to the Instruction Register (IR).
- ii. From the instruction register it goes to the decoder circuitry, which is within the CPU.
- iii. The decoder circuitry decodes the opcode.
- iv. After the opcode is decoded the CPU comes to know what operation is to be performed, and then execution begins.

**3. Execute cycle :**

- i. In this cycle, function of the instruction is performed.
- ii. If the instruction involves arithmetic or logic, ALU is utilized.

**Ques 3.5. Write the steps in fetching a word from memory.**

**Differentiate between a branch instruction and call subroutine instruction.**

**3-6 B (CSIT-Sem-3)****Answer**

Steps in fetching a word from memory are as follows:

**Step 1:** The CPU has to perform **opcode fetch cycle**.

**Step 2:** The **opcode fetch cycle gives the operation code of fetching a word** from memory to the CPU.

**Step 3:** The CPU then invokes the **operand fetch cycle**.

**Step 4:** The **opcode specifies the address of memory location where the information is stored.**

**Step 5:** The **CPU transfers the address of required word of information to the Address Register (AR), which is connected to the address lines of the memory bus. Hence, the address is transferred to the memory.**

**Step 6:** The CPU activates the **read signal of the memory to indicate that a read operation is needed.**

**Step 7:** As a result, memory copies data from the addressed register on the data bus.

**Step 8:** The CPU then reads this data from the data register and loads it in the specified register.

**Step 9:** Memory Functions Completed (MFC) is also used as a control signal for this memory transfer.

**Step 10:** Memory sets MFC to 1 to indicate that the contents of the specified location have been read and are available on the data bus.

**Difference :**

S.No.	Branch instruction	Subroutine instruction
1.	Branch instruction is a machine-language or assembly-language instruction.	Subroutine is a control transfer instruction.
2.	It is used to change the sequence of instruction execution.	It is used to call a subroutine.

**Ques 3.6. Assuming that all registers initially contain 0, what is the value of  $R_1$  after the following instruction sequence is executed:**

MOV R<sub>1</sub>, #6  
MOV R<sub>2</sub>, #5  
ADD R<sub>3</sub>, R<sub>1</sub>, R<sub>1</sub>  
SUB R<sub>3</sub>, R<sub>3</sub>, R<sub>3</sub>  
MUL R<sub>3</sub>, R<sub>1</sub>, R<sub>1</sub>

**Answer**

(Directly move 6 to the register R<sub>1</sub>)

**MOV R<sub>2</sub>, R<sub>3</sub>**

[Take another register in which directly move 5 into it]

**ADD R<sub>2</sub>, R<sub>1</sub>, R<sub>3</sub>**

[Value stored in R<sub>1</sub> added to R<sub>2</sub> again and then stored in R<sub>3</sub>]

**SUB R<sub>2</sub>, R<sub>3</sub>, R<sub>1</sub>**

[Value of R<sub>2</sub> is subtracted from R<sub>3</sub> and move into the R<sub>1</sub>]

**MUL R<sub>2</sub>, R<sub>3</sub>, R<sub>1</sub>**

[Multiply R<sub>2</sub> with R<sub>3</sub> and store into R<sub>1</sub>]

**Thus, R<sub>2</sub> has a value of 12.**

**Thus, R<sub>3</sub> has a value of 12.**

**(Value of R<sub>2</sub> is subtracted from R<sub>3</sub> and move into the R<sub>1</sub>)**

**Thus R<sub>1</sub> has a value of = R<sub>3</sub> - R<sub>2</sub> = 12 - 5 = 7**

**Thus, the final execution of this statement will give 49 and R<sub>1</sub> contains 7 as value stored in it.**

### Ques 3.7.

In an instruction format, there are 16 bits in an instruction word. Bit 0 to 11 convey the address of the memory location for memory related instructions. For non memory instructions these bits convey various register or I/O operations. Bits 12 to 14 show the various basic memory operations such as ADD, AND, LDA etc. Bit 15 shows if the memory is accessed directly or indirectly. For such an instruction format draw block diagram of the control unit of a computer and briefly explain how an instruction will be decoded and executed, by this control unit.

**AKTU 2016-17, Marks 10**

### Answer

- Consider the instruction code format shown in Fig. 3.7.1(a). It consists of a 3-bit operation code, a 12-bit address, and an indirect address mode bit designated by *I*.
- The mode bit is 0 for a direct address and 1 for an indirect address.
- A direct address instruction is shown in Fig. 3.7.1(b). It is placed in address 22 in memory. The *I* bit is 0, so the instruction is recognized as a direct address instruction.
- The opcode specifies an ADD instruction, and the address part is the binary equivalent of 457.
- The control finds the operand in memory at address 457 and adds it to the content of AC.
- The instruction in address 35 shown in Fig. 3.7.1(c) has a mode bit *I* = 1. Therefore, it is recognized as an indirect address instruction.
- The address part is the binary equivalent of 300. The control goes to address 300 to find the address of the operand.
- The address of the operand in this case is 1350. The operand found in address 1350 is then added to the content of AC.
- The indirect address instruction needs two references to memory to fetch an operand.

### 3-8 B (CSTT-Sem-3)

### Control Unit

(a) Instruction format

Memory

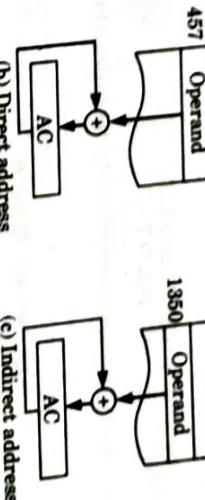

Fig. 3.7.1.

Instruction will be decoded and executed by this control unit :

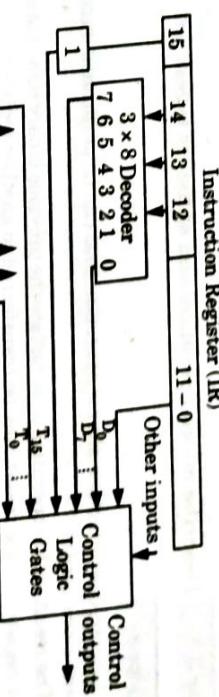

Fig. 3.7.2. Block diagram of control unit of a computer.

- Control unit consists of :
  - Instruction register
  - Number of control logic gates
  - Two decoders
  - 4-bit sequence counter
- An instruction read from memory is placed in the Instruction Register (IR).
- The instruction register is divided into three parts : the *I* bit, operation code, and address part.

4. First 12-bits (0 - 11) are applied to the control logic gates.
5. The operation code bits (12 - 14) are decoded with a  $3 \times 8$  decoder.
6. The eight outputs ( $D_0$  through  $D_7$ ) from a decoder go to the control logic gates to perform specific operation.
7. Last bit 15 is transferred to a  $J$  flip-flop designated by symbol  $J$ .
8. The 4-bit Sequence Counter (SC) can count in binary from 0 through 15.
9. The counter output is decoded into 16 timing pulses  $T_0$  through  $T_{15}$ .
10. The sequence counter can be incremented by INR input or clear by CLR input synchronously.

### PART-3

*Micro-operation Execution of Complete Instruction.*

#### Questions-Answers

#### Long Answer Type and Medium Answer Type Questions

**Ques 3.8.** Describe micro-operation and enlist its types.

#### Answer

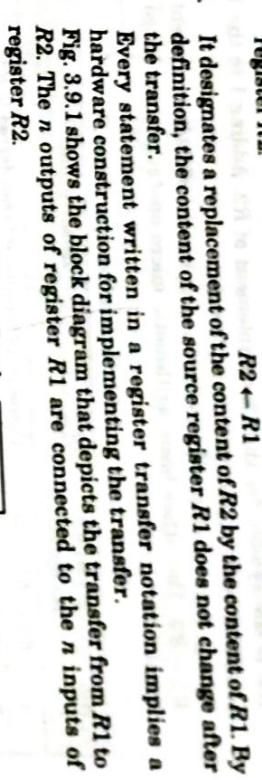

1. A micro-operation is a simple operation that can be performed during one clock period.
2. The result of this operation may replace the previous binary information of register or the result may be transferred to another register.
3. Examples of micro-operations are shift, move, count, add and load etc.
4. The micro-operations most often encountered in digital computers are classified into four categories :

- i. **Register transfer micro-operations** : It transfer binary information from one register to another.
- ii. **Arithmetic micro-operations** : It perform arithmetic operation on numeric data stored in registers.
- iii. **Logic micro-operations** : It perform bit manipulation operations on non-numeric data stored in registers.
- iv. **Shift micro-operations** : It perform shift operations on data stored in registers.

**Ques 3.9.** Write a short note on register transfer micro-operation.

#### Answer

1. Register transfer is defined as information transfer from one register to another and is designated in symbolic form by means of a replacement operator.

**Fig. 3.9.1. Block diagram.**

6. The letter  $n$  will be used to indicate any number of bits for the register. It will be replaced by an actual number when the length of the register is known.
7. Register  $R2$  has a load input that is activated by the control variable  $P$ . The basic symbols of the register transfer notations are listed in Table 3.9.1.

**Table 3.9.1. Basic symbols for register transfers.**

S. No.	Symbol	Description	Examples
1.	Letters (and numerals)	Denotes a register	MAR, $R_2$
2.	Parentheses ()	Denotes a part of a register	$R_2(0-7), R_2(L)$
3.	Arrow ( $\leftarrow$ )	Denotes transfer of information	$R_2 \leftarrow R_1$
4.	Comma,	Separates two micro-operations	$R_2 \leftarrow R_1, R_1 \leftarrow R_2$

**Ques 3.10.** Write short note on arithmetic micro-operation.

#### Answer

1. The basic arithmetic micro-operations are addition, subtraction, increment and decrement. The arithmetic micro-operation defined by the statement,  $R_3 \leftarrow R_1 + R_2$  which specifies an addition micro-operation.
2. It states that the contents of register  $R_1$  are added to the contents of register  $R_2$  and the sum is transferred to register  $R_3$ .
3. Subtraction is implemented through complementation and addition, which is specified in following statement :

$$R3 \leftarrow R1 + \bar{R}2 + 1$$

$\bar{R}2$  is the symbol for the 1's complement of  $R2$ . Adding 1 to the 1's complement produce the 2's complement.

4. Adding the contents of  $R1$  to the 2's complement of  $R2$  is equivalent to  $R1 - R2$ . The other basic arithmetic micro-operations are listed in Table 3.10.1.

Table 3.10.1 : Arithmetic micro-operations.

S. No.	Symbolic designation	Description
1.	$R3 \leftarrow R1 + R2$	Contents of $R1$ plus $R2$ transferred to $R3$ .
2.	$R3 \leftarrow R1 - R2$	Contents of $R1$ minus $R2$ transferred to $R3$ .
3.	$R2 \leftarrow \bar{R}2$	Complement the contents of $R2$ (1's complement).
4.	$R2 \leftarrow \bar{R}2 + 1$	2's complement the contents of $R2$ (negate).
5.	$R3 \leftarrow R1 + \bar{R}2 + 1$	$R1$ plus the 2's complement of $R2$ (subtraction).
6.	$R1 \leftarrow R1 + 1$	Increment the contents of $R1$ by one.
7.	$R1 \leftarrow R1 - 1$	Decrement the contents of $R1$ by one.

**Que 3.11.** Write a short note on logic micro-operation.**Answer**

1. Logic micro-operations specify binary operations for strings of bits stored in registers.

2. These operations consider each bit of the register separately and treat the contents of two registers  $R1$  and  $R2$  symbolized by the statement

$$P : R1 \leftarrow R1 \oplus R2$$

3. It specifies a logic micro-operation is to be executed on the individual bits of the registers provided that the control variable  $P = 1$ . For example, the content of  $R1$  is 1010 and content of  $R2$  is 1100. The logic computation :

$$\begin{array}{l} 1010 \text{ content of } R1 \\ 1100 \text{ content of } R2 \\ \hline 0110 \text{ content of } R1 \text{ after } P = 1 \end{array}$$

5. There are 16 different logic operations that can be performed with two binary variables.

6. The Boolean functions of two variables  $x$  and  $y$  are expressed in algebraic form in first column of Table 3.11.1.

Table 3.11.1: Sixteen logic micro-operations.

S. No.	Boolean function	Micro-operation	Name
1.	$F_0 = 0$	$F \leftarrow 0$	Clear
2.	$F_1 = xy$	$F \leftarrow A \wedge B$	AND

**Que 3.12.** Write a short note on shift micro-operations.  
OR  
List and explain different types of shift micro-operation.

AKTU 2016-17, March 15

**Answer****Shift micro-operation :**

1. Shift micro-operations in computer architecture are those which are used in serial shifting of data present in a register.
2. Shift micro-operations move or shift data in a register bitwise that is, one bit at a time either left or right from its original position.

**List of different types of shift micro-operation :****a. Arithmetic shift micro-operation :**

- i. Arithmetic shift operation shifts signed (positive or negative) binary numbers either left or right by multiplying or dividing by 2.
- ii. For arithmetic shift left micro-operation, the value in the register is multiplied by 2 and whereas for arithmetic shift right micro-operation, the value in the register is divided by 2.
- iii. In RTL (Register Transfer Language), we can represent this arithmetic shift micro-operations as  
 $R \leftarrow \text{ashl } R$  (arithmetic shift left  $R$  (register))

- i.  $R \leftarrow \text{ashr } R$  (arithmetic shift right R (register))  
 iv. Fig. 3.12.1 showing arithmetic shift left operation is as follows:

Fig. 3.12.1.

- v. Fig. 3.12.2 showing arithmetic shift right operation is as follows:

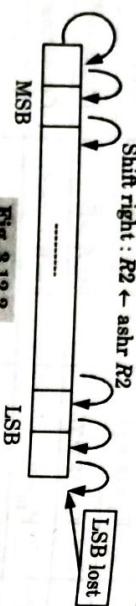

Fig. 3.12.2.

b. **Logical shift micro-operation :**

- i. A logical shift micro-operation transfers a 0 (zero) through the serial input, either from left or right depending on the type.
- ii. For logical shift left micro-operation, 0 (zero) is transferred through the right of the data and for the logical shift right micro-operation, 0 (zero) is transferred through the left of the data as shown in the Fig. 3.12.3.
- iii. Register Transfer Language (RTL) for the logical shift micro-operations can be written as :  
 $R \leftarrow \text{shl } R$  (shift left register (R)).  
 $R \leftarrow \text{shr } R$  (shift right register (R)).
- iv. Fig. 3.12.3 showing logical shift left micro-operation on the data in a register.

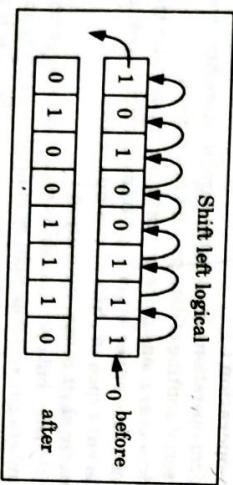

Fig. 3.12.3.

- v. Fig. 3.12.4 showing the logical shift right is as follows:

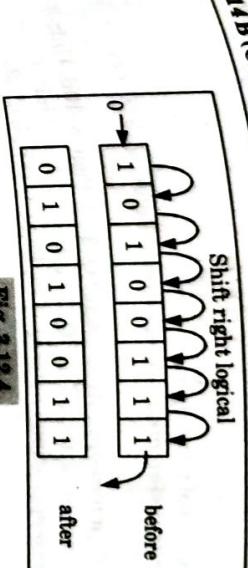

Fig. 3.12.4.

c. **Circular shift micro-operation :**

- i. A circular shift micro-operation performs the shifting of bits from one end of the register to the other end of the register.
- ii. In circular shift left operation, the leftmost bit in the register is transferred to the rightmost end and in the circular shift right operation, the rightmost bit in the register is transferred or shifted to the leftmost end of the register as shown in the Fig. 3.12.5 and Fig. 3.12.6 respectively.
- iii. Register transfer language for the circular shift micro-operations can be written as :  
 $R \leftarrow \text{cl } R$  (circular shift left register (R)).  
 $R \leftarrow \text{cir } R$  (circular shift right register (R)).
- iv. Fig. 3.12.5 showing circular shift left micro-operation.

Fig. 3.12.5.

- v. Fig. 3.12.6 showing circular shift right micro-operation.

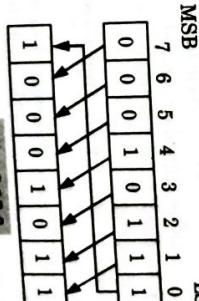

Fig. 3.12.6.

- Ques 3.13.** What are the different categories of micro-operations that may be carried out by CPU ? Explain each category of micro-operations giving one example for each.

**Answer**

Different categories of micro-operation are :

1. Register transfer micro-operation : Refer Q. 3.9, Page 3-9B, Unit-3.
2. Arithmetic micro-operation : Refer Q. 3.10, Page 3-10B, Unit-3.
3. Logic micro-operation : Refer Q. 3.11, Page 3-11B, Unit-3.
4. Shift micro-operation : Refer Q. 3.12, Page 3-12B, Unit-3.

**Que 3.14.** Discuss the execution of a complete instruction.

**Answer**

1. The execution of a complete instruction is explained by a simple addition instruction.
2. Consider the instruction,

$ADD [M], R_1$

register  $R_1$ .

The execution of this instruction requires the following steps :

- a. Fetch the instruction.
- b. Fetch the operand.
- c. Perform the addition.
- d. Load the result into  $R_1$ .

The first step of fetching the instruction is common to execution of all instructions.

The remaining steps depend upon the operation to be performed.

**Step 1:** The instruction fetch operation is initiated by loading the contents of the Program Counter (PC) into MAR and sending read request to memory to read the instruction from memory

(Now waiting for response from the memory)

**Step 2:** Memory read is requested.

The processor is to be delayed until the MFC (Memory Function Completed) signal is received. Once MFC is received the word fetched from the memory is transferred to instruction register.

**Step 4:** The contents of memory are transferred by memory read operation.

**Step 5:** The contents of  $R_1$  are transferred to one of the inputs of ALU. Now both operands are available in ALU inputs.

**Step 6:** Addition operation is performed.

**Step 7:** The result is transferred to  $R_1$ .

**Step 8:** It indicates that the end of the execution of the current instruction, and it causes a new fetch cycle to begin by returning to step 1.

**PART-4**

Program Control, Reduced Instruction Set Computer.

**Questions-Answers****Long Answer Type and Medium Answer Type Questions**

**Que 3.15.** What is CISC ? Explain its characteristics.

AKTU 2015-16, Marks 05

**Answer**

The term "CISC" (Complex Instruction Set Computer or Computing) refers to computers designed with a full set of computer instructions that were intended to provide needed capabilities in the most efficient way.

1. Due to large number of addressing modes for the operations and instructions, the CISC computer generally require fewer instructions to perform the computation.
2. CISC has complex instruction sets variable length encoding of instructions and instruction execution takes varying number of clock cycles.
3. Programs writing for CISC architectures tend to take less space in memory.

**Characteristics of CISC :**

1. If the frequency of complex operation is high, then the performance of the CISC machine is better to implement.
2. CISC tends to have many instruction formats to accommodate more opcode types and operand addressing method.
3. CISC has many instruction formats.
4. CISC processor provides direct manipulation of operands residing in memory.

**Que 3.16.** Discuss the advantages and disadvantages of using a variable length instruction format.

**Answer**

**Advantages of using a variable length instruction format :**

1. In variable length instructions format, it is easy to provide a large collection of opcodes with different opcode lengths.
2. Addressing can be more flexible with various combinations of register and memory references plus addressing modes.

**Computer Organization & Architecture****2-17 B (CSEIT-Sem-3)**

3. The use of variable length instructions does not remove the desirability of making all of the instruction lengths integrally related to the word length.

4. It is more efficient.  
5. It is more compact with a combination of register memory addressing modes.

**Disadvantages of using a variable length instruction format**

1. The main disadvantage of variable length instructions is increase in the complexity of the processor.
2. It does not remove desirability of instruction length which is integrally related to word length.

**Que 3.17.** Write a short note on RISC.

OR

**AKTU 2014-15, Marks 05**

What is RISC ? Explain its various characteristics.

**AKTU 2015-16, Marks 05**

**Answer**

1. RISC (Reduced Instruction Set Computer) processor instruction has a fixed length encoding of instruction and each instruction executes in a single clock cycle by hardwired implementation of each instruction.
2. RISC architecture focus on reducing the number of instructions and working with simpler instruction set having limited number of addressing modes and allowing them to execute more instructions in the same amount of time.
3. Programs written for RISC architectures tend to make more space in memory but RISC processor's increased clock rate allows it to execute its program in less time than a CISC processor takes to execute its program.

**RISC characteristics :**

1. Simple instructions are used in RISC architecture.
2. RISC helps and supports few simple data types and synthesizes complex data types.
3. RISC utilizes simple addressing modes and fixed length instructions for pipelining.
4. RISC permits any register to use in any context.

**Que 3.18.** Differentiate between RISC & CISC based microprocessor.

OR

**AKTU 2017-18, Marks 07**

Differentiate between complex instruction set computer and reduced instruction set computer.

OR

<b>Give the detailed comparison between RISC and CISC.</b>	
<b>AKTU 2016-17, Marks 10</b>	
<b>Answer</b>	

<b>RISC</b>	<b>CISC</b>
1. Multiple register sets, often consisting of more than 256 registers.	Single register set, often consisting 6 to 16 registers total.
2. Three register operands allowed per instruction (for example, add R1, R2, R3).	One or two register operands allowed per instruction (for example, add R1, R2).
3. Parameter passing through efficient on-chip register windows.	Parameter passing through inefficient off-chip memory.
4. Single-cycle instructions (except for load and store).	Multiple-cycle instructions.
5. Hardwired control.	Micro-programmed control.
6. Highly pipelined.	Less pipelined.
7. Simple instructions are few in number.	There are many complex instructions.
8. Fixed length instructions.	Variable length instructions.
9. Complexity in compiler.	Complexity in microcode.
10. Only load and store instructions can access memory.	Many instructions can access memory.
11. Few addressing modes.	Many addressing modes.

**PART-5****Pipelining****Questions-Answers****Long Answer Type and Medium Answer Type Questions**

**Que 3.19.** What is pipelining ? How the idea of pipelining used in a computer?

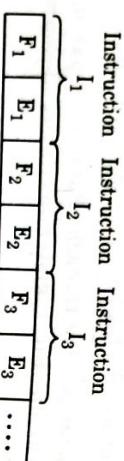

OR

3-20B (CS/IT-Sem-3)

Control Unit

**Write a short note on pipelining.****AKTU 2018-19, Marks 3.5****Answer**

- Pipelining is a technique of decomposing a sequential process into sub-operations, with each sub-process being executed in a special dedicated segment that operates concurrently with all other segments.
- The processor executes a program by fetching and executing instructions, one after the other.
- Let  $F_i$  and  $E_i$  refer to the fetch and execute steps for instruction  $I_i$ . Execution of a program consists of a sequence of fetch and execute steps as shown in Fig. 3.19.1.

**Fig. 3.19.1. Sequential execution.****5. Now consider a computer that has two separate hardware units, one for fetching instructions and another for executing them, as shown in Fig. 3.19.2.**

- The instruction fetched by the fetch unit is deposited in an intermediate storage buffer  $B_i$ .
- The results of execution are deposited in the destination location specified by the instructions.
- For these purposes, we assume that both the source and destination of "data operated in" by the instructions are inside the block labelled "Execution unit".

**Fig. 3.19.2. Hardware organization.**

- The computer is controlled by a clock whose period is such that the fetch and execute steps of any instruction can be completed in one clock cycle.
- Operation of the computer proceeds as in Fig. 3.19.3.

Clock cycle instruction 1 2 3 4

$I_1$	$F_1$ $E_1$
$I_2$	$F_2$ $E_2$
$I_3$	$F_3$ $E_3$

**Fig. 3.19.3.**

- In the first clock cycle, the fetch unit fetches an instruction  $I_1$  (step  $F_1$ ) and stores it in buffer  $B_1$  at the end of the clock cycle.

**Write short notes on instruction pipeline.****AKTU 2018-19, Marks 3.5****Answer****Classification of pipeline:****1. Arithmetic pipelining:**

- The arithmetic logic units of a computer can be segmentized for pipeline operations in various data format as shown in Fig. 3.20.1.
- The four-stage pipeline used in Star-100, the eight-stage pipeline used in the TI-ASC, the up to 14 stages pipeline used in the Cray-1 are the example of arithmetic pipeline.

**Fig. 3.20.1. Arithmetic pipelining.****2. Processor pipelining:**

- This refers to pipeline processing of the same data stream by a cascade of processors each of which processes a specific task as shown in Fig. 3.20.2.
- The data stream passes the first processor with results stored in a memory block, which is also accessible, by the second processor.
- The second processor then passes the refine results to the third, and so on.
- The pipelining of multiple processors is not yet well accepted as a common practice.

- In the second clock cycle, the instruction fetch unit proceeds with the fetch operation for instruction  $I_2$  (Step  $F_2$ ). Meanwhile, the execution unit performs the operation specified by the instruction  $I_1$ , which is available to it in buffer  $B_1$  (Step  $E_1$ ). By the end of the second clock cycle, the execution of instruction  $I_1$  is completed and instruction  $I_2$  is available.
- Instruction  $I_2$  is stored in  $B_1$  by replacing  $I_1$ , which is no longer needed. Step  $E_2$  is performed by the execution unit during the third clock cycle, while instruction  $I_3$  is being fetched by the fetch unit. In this manner, both fetch and execute units are kept busy all the time.

**Que 3.20. How pipelining is classified ?**

OR

So, speed-up ( $S$ ) of the pipelined processor over non-pipelined processor, when ' $n$ ' tasks are executed on the same processor is :

$S = \text{Performance of pipelined processor} / \text{Performance of non-pipelined processor}$

As the performance of a processor is inversely proportional to the execution time, we have,

$$S = ET_{\text{non-pipeline}} / ET_{\text{pipeline}}$$

$$S = [n * k * T_p] / [(k + n - 1) * T_p]$$

When the number of tasks ' $n$ ' are significantly larger than  $k$ , that is,  $n \gg k$

where ' $k$ ' are the number of stages in the pipeline.

Also, Efficiency = Given speed-up / Max speed up =  $S / S_{\max}$

We know that,  $S_{\max} = k$

So, Efficiency =  $S / k$

Throughput = Number of instructions / Total time to complete the instructions

So, Throughput =  $n / (k + n - 1) * T_p$

### Que 3.22. Differentiate between linear and non-linear pipeline.

#### Answer

#### Linear pipeline      Non-linear pipeline

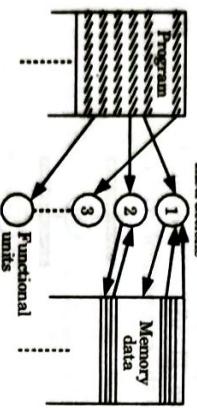

Fig. 3.20.3. Instruction pipelining.

### Que 3.21. What are the various pipeline performance measures ?

#### Answer

There are following terms which are used to measure a pipeline performance:

1. Speed-up
  2. Efficiency
  3. Throughput
- Consider a ' $k$ ' segment pipeline with clock cycle time as ' $T$ '. Let there be ' $n$ ' tasks to be completed in the pipelined processor. Now, the first instruction is going to take ' $k$ ' cycles to come out of the pipeline but the other ' $n - 1$ ' instructions will take only '1' cycle each, i.e., a total of ' $n - 1$ ' cycles. So, time taken to execute ' $n$ ' instructions in a pipelined processor :

$ET_{\text{pipeline}} = k + n - 1 \text{ cycles} = (k + n - 1) T_p$

In the same case, for a non-pipelined processor, execution time of ' $n$ ' instructions will be :

$$ET_{\text{non-pipeline}} = n * k * T_p$$

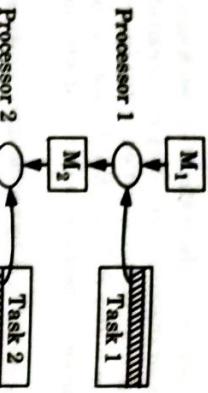

Fig. 3.20.2. Processor pipelining.

### 3. Instruction pipelining :

- a. The execution of a stream of instructions can be pipelined by overlapping the execution of the current instruction with the fetch, decode, and operand fetch of subsequent instructions as shown in Fig. 3.20.3.
- b. This technique is also known as instruction look ahead.
- c. Almost all high-performance computers are now equipped with instruction-execution pipelines.

S.No.	Linear pipeline	Non-linear pipeline
1.	Static pipeline	Dynamic pipeline
2.	Allows only streamline connections.	Allows feed-forward and feedback connections in addition to the streamline connection.
3.	Function partitioning is easy.	Function partitioning is relatively difficult.
4.	The output is produced from the last stage.	The output is not necessarily produced from the last stage.
5.	The reservation table is trivial in the sense that data flows in linear streamline.	The reservation table is non-trivial in the sense that there is no linear streamline for data flows.
6.	Have single reservation table.	Have more than one reservation table.
7.	All initiations to a static pipeline use the same reservation table.	A dynamic pipeline may allow different initiations to follow a mix reservation tables.
8.	Used to perform fixed function.	Used to perform variable function at different time.

**PART-6**

**Hardwired and Micro-programmed Control :**  
**Micro-programme Sequencing.**

**Questions-Answers****Long Answer Type and Medium Answer Type Questions**

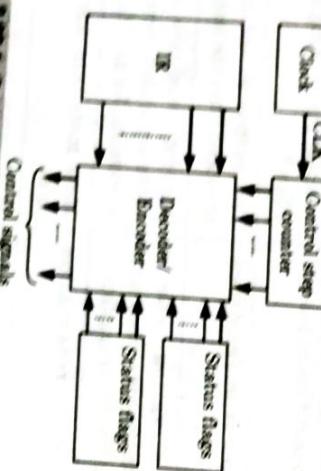

**Que 3.23.** Explain hardwired control unit. What are the methods to design hardwired controllers ?

**OR**  
**AKTU 2017-18, Marks 35**

What do you understand by hardwired control ? Give various methods to design hardwired control unit. Describe any one method used for designing of hardwired control unit.

**Answer**

- It is a controller as a sequential logic circuit or a finite state machine that generates a sequence of control signals in response to the externally supplied instructions.
- The control logic is implemented with gates, flip-flops, decoders, and other digital circuits.

**Fig. 3.23.1 General block diagram of hardwired control.**

- A hardwired control requires changes in the wiring among the various components if the design has to be modified or changed.
- Its input logic signals are transformed into a set of output logic signals.
- Each step in this sequence is completed in one clock cycle.

**3-24 B (CSIT-Sem-3)**

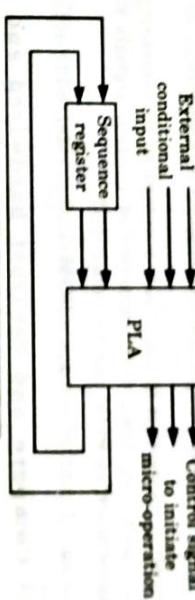

- A counter may be used to keep the track of the control steps.
- The required control signals are determined by the following information :
  - Contents of the control step counter.
  - External input signals such as MFC and interrupt request.
  - Contents of the condition code flags.
  - External input signals such as MFC and interrupt request.

**Methods to design hardwired control :** There are four simplified and systematic methods for the design of hardwired controllers.

- State table method or one-hot method.
- Delay element method.
- Sequence-counter method.
- PLA method.

**PLA method :**

- PLA (Programmable Logic Array) is an important device of digital system.
- We can implement a large combinational logic circuit or sequential logic circuit in a PLA.

**Fig. 3.24.1 PLA control unit.**

- It replaces more number of MSI (Medium Scale Integration) and SSI (Small Scale Integration) by its single device chip.
- The decision logic function and decoder functions are implemented in the Programmable Logic Array (PLA).
- It is possible to reduce the number of ICs and the number of interconnection wires. The PLA output is the next state of the sequence register.

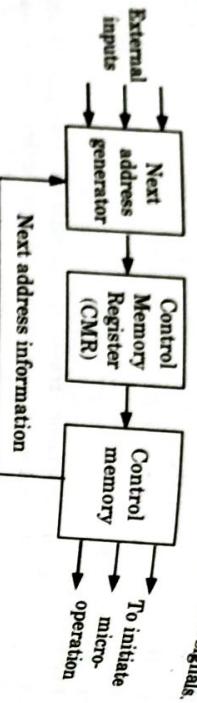

**Que 3.24.** Discuss the basic structure of micro-program control unit.

**OR**  
**Explain micro-programmed control unit.**

- Micro-programmed control is a method of control unit design in which the control signal selection and sequencing information is stored in a ROM or RAM called a Control Memory (CM).

**Answer**

2. The sequence of control signals to be generated by the controller can be stored in a special Read Only Memory (ROM) also called Control Memory (CM).
3. Memory control word is written for each micro-operation, and these control words are stored in a serial ascending memory location, and these control words are stored in the ROM permanently.
4. The control word is accessed serially (serial access memory) from the control memory.
5. Control words are stored in the ROM permanently.
6. The output of the control memory provides the required control signals.

**Fig 3.24.1** Block diagram of micro-programmed control unit.

7. If the control memory is sequentially accessed by incrementing control memory location, then the sequence of control signals stored in successive word of ROM can be generated.
8. The storage of control word in a ROM is often referred to as firmware.

**Ques 3.25** Compare and contrast hardwired and micro-programmed control units. Also lists their advantages and disadvantages.

**AKTU 2014-15, Marks 10**

Explain hardwired and micro-programmed control and compare them.

OR

What are the differences between hardwired and micro-programmed control unit?

**AKTU 2015-16, Marks 06**

Explain the basic concept of hardwired and software control unit with neat diagrams.

**AKTU 2018-19, Marks 07**

**Ans:** Hardwired control : Refer Q. 3.23, Page 3-23B, Unit-3.

Micro-programmed control : Refer Q. 3.24, Page 3-24B, Unit-3.

### 3-26 B (CSE/T-Sem-3)

Control Unit

Comparison between hardwired control and micro-programmed control :

S.No.	Characteristics	Hardwired control	Micro-programmed control
1.	Speed	Fast	Slow
2.	Implementation	Hardware	Software
3.	Flexibility	Not flexible	Flexible
4.	Ability to handle large/ complex instruction set	Somewhat difficult	Easier
5.	Ability to support operating system and diagnostic features	Very difficult	Easy
6.	Design process	Difficult for more operation	Easy
7.	Memory	Not used	Control memory used (RAM or ROM)
8.	Chip area efficiency	Uses less area	Uses more area
9.	Used in	RISC processor	CISC processor
10.	Output generation	On the basis of input signal	On the basis of control line.

Advantage of hardwired control unit :

1. Speed is high.
2. Expensive to implement.
3. More error prone.

Disadvantages of hardwired control unit :

1. Contain complex logic.
2. Cheaper to implement.
3. Less error prone.

Advantages of micro-programmed control unit :

1. Contain very simple piece of logic.
2. Speed is slow.

Disadvantage of micro-programmed control unit :

**Ques 3.26** What is micro-programmed control unit ? Give the basic structure of micro-programmed control unit. Also discuss the micro-instruction format and the control unit organisation for a typical micro-programmed controllers using suitable diagram.

**Ans:** AKTU 2017-18, Marks 07

**Answer**

**Micro-programmed control unit and its structure :** Refer Q. 3.24, Page 3-24B, Unit-3.

**Micro-instruction formats:** The micro-instruction format for the control memory is shown in the Fig. 3.26.1.

3	3	3	2	2	7
F1	F2	F3	CD	BR	AD

F1, F2, F3 : Micro-operation fields

CD : Condition for branching

BR : Branch field

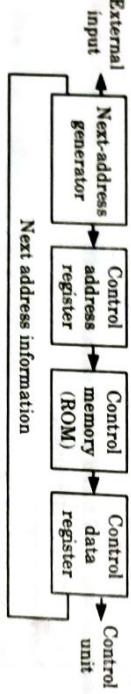

AD : Address field

**Fig. 3.26.1. Micro-instruction format.**

The 20 bits of the micro-instruction are divided into four functional parts as follows :

1. The three fields F1, F2, and F3 specify micro-operations for the computer.
2. The micro-operations subdivided into three fields of three bits each. The three bits in each field are encoded to specify seven distinct micro-operations. So, this gives a total of 21 micro-operations.
3. The CD field selects status bit conditions.
4. The BR field specifies the type of branch to use.

5. The AD field contains a branch address. The address field is seven bits wide since the control memory has  $128 = 2^7$  words.
6. The general configuration of a micro-programmed control unit is demonstrated in the block diagram of Fig. 3.26.2.
7. The control memory is assumed to be a ROM, within which all control information is permanently stored.

**Fig. 3.26.2. Micro-programmed control organization.**

3. The control memory address register specifies the address of the micro-instruction, and the control data register holds the micro-instruction read from memory.
4. The micro-instruction contains a control word that specifies one or more micro-operations for the data processor. Once these operations are executed, the control must determine the next address.
5. The location of the next micro-instruction may be the one next in sequence, or it may be located somewhere else in the control memory.
6. While the micro-operations are being executed, the next address is computed in the next address generator circuit and then transferred into the control address register to read the next micro-instruction.

**3-28B (CSIT-Sem-3)**

7. Thus a micro-instruction contains bits for initiating micro-operations in the data processor part and bits that determine the address sequence for the control memory.

8. The next address generator is sometimes called a micro-program sequencer, as it determines the address sequence that is read from control memory.
9. Typical functions of a micro-program sequencer are incrementing the control address register by one, loading into the control address register an address from control memory, transferring an external address, or loading an initial address to start the control operations.
10. The control data register holds the present micro-instruction while the next address is computed and read from memory.

**Que 3.27. Explain micro-program sequencer with block diagram.**

Compare horizontal and vertical organization.

OR

Explain micro-program sequencer for a control memory using a suitable block diagram.

1. Explain micro-program sequencer for a control memory using a suitable block diagram.
- OR
- AKTU 2016-17, Marks 10

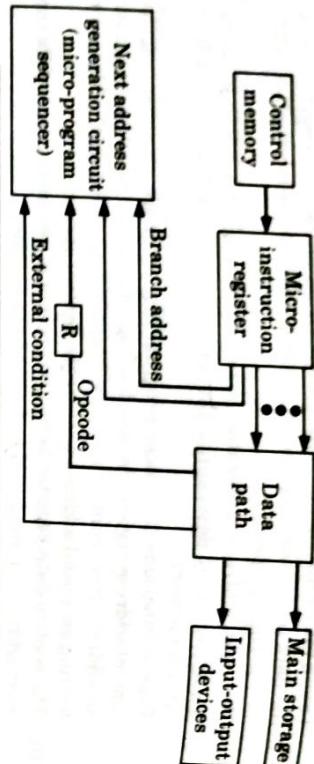

- What is a micro-program sequencer? With block diagram, explain the working of micro-program sequencer.
- AKTU 2016-19, Marks 07

**Answer**

1. Micro-program sequencer is a general purpose building block for micro-programmed control unit.
2. The basic components of a micro-programmed control unit are the control memory and the circuit that selects the next address.
3. The address selection part is called micro-program sequencer.
4. The main purpose of micro-program sequencer is to present an address to the control memory so that micro-instruction may be read and executed.
5. The next address logic of the sequencer determines the specific address source to be loaded into the control address register.
6. The choice of the address source is guided by the next address information bits that sequencer receives from the present micro-instruction.
7. All the instructions are loaded in the control memory.

**3-30 B (CSIT-Sem-3)**

- c. Branches to a given address if a specified status bit is equal to 1.
- d. Transfer control to a new address as specified by an external source (Instruction Register).
- e. Has a facility for subroutine calls and returns.
5. Depending on the current micro-instruction condition flags, and the contents of the instruction register, a control memory address must be generated for the next micro-instruction.

**Fig. 3.37.1. Block diagram of micro-programmed control with micro-program sequencer.**

8. The present micro-instruction is placed in micro-instruction register for execution.

S.No.	Horizontal Organization	Vertical Organization
1.	Long format.	Short format.
2.	Ability to express a high degree of parallelism.	Limited ability to express parallel micro-operations.
3.	Little encoding of control information.	Considerable encoding of the control information.
4.	Useful when higher operating speed is desired.	Slower operating speed.

**Que 3.26. Describe micro-program sequencing in detail.****Answer**

- Micro-program sequencing is a process of controlling the generation of next address.
- Micro-program sequencing is done with the help of micro-program sequencer.
- A micro-program sequencer attached to a control memory inputs certain bits of the micro-instruction, from which it determines the next address for control memory.
- A typical sequencer provides the following address-sequencing capabilities :
  - Increment the present address for control memory.
  - Branches to an address as specified by the address field of the micro-instruction.

**Que 3.29. Explain the concept of vertical and horizontal multi-programming.****Answer****Vertical micro-programming :**

- In the case of vertical micro-programming, each line of the micro-program represents a micro-instruction which specifies one or more micro-operations.
- One micro-instruction gets executed during each step of the control sequence. One can use a straight binary code to specify each micro-operation.

**Horizontal micro-programming :**

- Rather than provide for only one micro-operation per step and use a single decoder for the entire micro-instruction field, it is in fact possible to partition this field into a number of mutually exclusive subfields which can be independently decoded in separate decoder.
- This approach yields a more cost-effective design. If the system design needs in all a total of  $N$  different micro-operations one will have to provide for  $\log_2 N$  bit to specify a micro-operation.
- If only one micro-operation per micro-instruction is allowed, then one would require  $\log_2 N$  bit per micro-instruction.
- A typical sequencer provides the following address-sequencing capabilities :
  - Increment the present address for control memory.
  - Branches to an address as specified by the address field of the micro-instruction.
- In horizontal micro-programming, one associates each bit of the micro-instruction with a specific micro-operation (bit  $I$  to represent micro-operation  $I$ ).
- A specific micro-operation is executed during a micro-instruction step only if the corresponding bit is one.

**PART-7****Concept of Horizontal and Vertical Micro-programming.****Questions/Answers****Long Answer Type and Medium Answer Type Questions**

3. For instance, micro-operation *I* is executed if the *J<sup>th</sup>* bit is one; it is not executed otherwise.
4. A micro-code decoder will no longer be required in this case because no coding is involved.
5. This scheme will require a total of *N* bits per micro-instruction (to accommodate *N* different micro-operations).
6. The advantage with horizontal micro-programming is that several micro-operations can be executed during each micro-instruction step.
7. In fact, this scheme permits one to execute all the micro-operations provided in the computer in a single micro-instruction.

**Que 3.30.** Briefly define the following terms :

- i. Micro-operation
- ii. Micro-instruction
- iii. Micro-program
- iv. Micro-code

v. Control memory

**Que 3.32.** Explain 4-bit incrementer with a necessary diagram.

**AKTU 2016-17, Marks 15**

**Answer**

1. The diagram of a 4-bit combinational circuit incrementer is shown in Fig. 3.32.1.

2. One of the inputs to the least significant Half Adder (HA) is connected to logic-1 and the other input is connected to the least significant bit of the number to be incremented.
  3. The output carry from one half-adder is connected to one of the inputs of the next-higher-order half-adder.
  4. The circuit receives the four bits from  $A_0$  through  $A_3$  adds one to it, and generates the incremented output in  $S_0$  through  $S_3$ .
  5. The output carry  $C_4$  will be 1 only after incrementing binary 1111. This also causes outputs  $S_0$  through  $S_3$  to go to 0.
  6. This micro-operation is easily implemented with a binary counter.
- v. **Control memory :**
  1. Control memory is a Random Access Memory (RAM) consisting of addressable storage registers.

2. It is used as a temporary storage for data.
3. Access to control memory data requires less time than to main memory, this speeds up CPU operation.

- Que 3.31.** Write an assembly level program for the following pseudo code :

$$\text{SUM} = 0$$

$$\text{SUM} = \text{SUM} + A + B$$

$$\text{DIF} = \text{DIF-C}$$

$$\text{SUM} = \text{SUM} + \text{DIF}$$

**AKTU 2016-17, Marks 10**

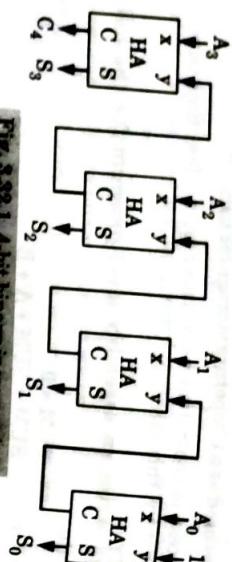

Fig. 3.33.1. 4-bit binary incrementer.

7. Every time the count enable is active, the clock pulse transition increments the content of the register by one.

8. There may be occasions when the increment micro-operation must be done with a combinational circuit independent of a particular register.

9. This can be accomplished by means of half adders connected in cascade.

- Que 3.33.** Write a program loop using a pointer and a counter to clear the contents of hex locations 500 to 5FF with 0.

AKTU 2016-17, Marks 15

**Answer**

```

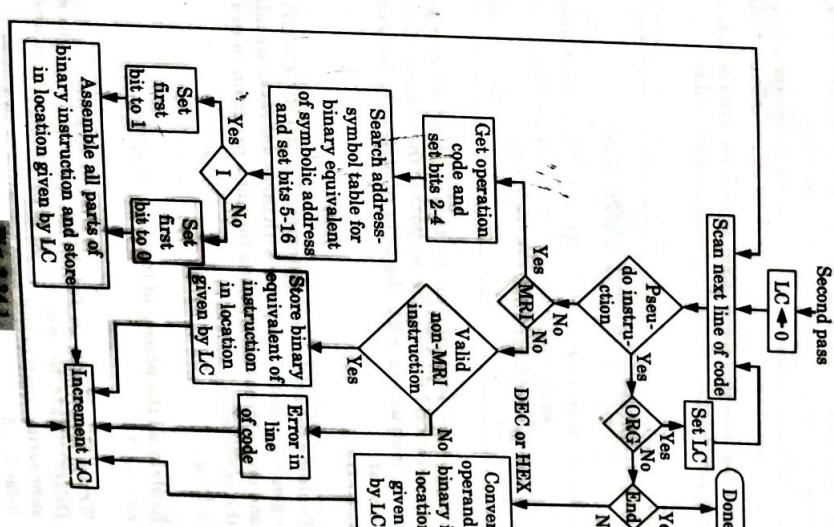

LDA NBR           / Initialize counter
CMA             / 2's complement of NBR INC
STA CTR          / save -NBR to counter

NBR, HEK IF      / NBR of cleared words
CTR, -           / Counter
ADR, HEK { }     / Start address
PTR, -           / Pointer
    
```

- Que 3.34.** Demonstrate the process of second pass of assembler using a suitable diagram.

AKTU 2016-17, Marks 15

**3-34 B (CS/IT-Sem-3)****Control Unit**

1. Machine instructions are translated during the second pass by means of table-lookup procedures.
2. A table-lookup procedure is a search of table entries to determine whether a specific item matches one of the items stored in the table.
3. The assembler uses four tables.
4. Any symbol that is encountered in the program must be available as an entry in one of these tables; otherwise, the symbol cannot be interpreted.

5. We assign the following names to the four tables :

- a. Pseudo instruction table
- b. MRI table
- c. Non-MRI table
- d. Address symbol table

6. The entries of the pseudo instruction table are the four symbols ORG, END, DEC, and HEX.
7. Each entry refers the assembler to a subroutine that processes the pseudo instruction when encountered in the program.
8. The MRI table contains the seven symbols of the memory-reference instructions and their 3-bit operation code equivalent.
9. The non-MRI table contains the symbols for the 18 register-reference and input-output instructions and their 16-bit binary code equivalent.
10. The assembler searches these tables to find the symbol that it is currently processing in order to determine its binary value.

### VERY IMPORTANT QUESTIONS

*Following questions are very important. These questions may be asked in your SESSIONALS as well as UNIVERSITY EXAMINATION.*

- Q.1. What is an instruction in the context of computer organization ? Explain the purpose of the various elements of an instruction with the help of a sample instruction  
**Ans.** Refer Q. 3.1.
- Q.2. Evaluate the arithmetic statement  $X = (A + B)*(C + D)$  using a general register computer with three address, two address and one address instruction format a program to evaluate the expression.  
**Ans.** Refer Q. 3.3.
- Q.3. Explain all the phases of instruction cycle.  
**Ans.** Refer Q. 3.4.
- Q.4. Write the steps in fetching a word from memory. Differentiate between a branch instruction and call subroutine instruction.  
**Ans.** Refer Q. 3.5.
- Q.5. In an instruction format, there are 16 bits in an instruction word. Bit 0 to 11 convey the address of the memory location for memory related instructions. For non memory instructions these bits convey various register or I/O operations. Bits 12 to 14 show the various basic memory operations such as ADD, AND, LDA etc. Bit 15 shows if the memory is accessed directly or indirectly. For such an instruction format draw block diagram of the control unit of a computer and briefly explain how an instruction will be decoded and executed, by this control unit.  
**Ans.** Refer Q. 3.7.
- Q.6. List and explain different types of shift micro-operation.  
**Ans.** Refer Q. 3.12.
- Q.7. What are the different categories of micro-operations that may be carried out by CPU ? Explain each category of micro-operations giving one example for each.  
**Ans.** Refer Q. 3.13.
- Q.8. What is CISC ? Explain its characteristics.  
**Ans.** Refer Q. 2.15.
- Q.9. What is RISC ? Explain its various characteristics.  
**Ans.** Refer Q. 3.17.
- Q.10. Give the detailed comparison between RISC and CISC.  
**Ans.** Refer Q. 3.18.
- Q.11. Write a short note on pipelining.  
**Ans.** Refer Q. 3.19.
- Q.12. Explain the basic concept of hardwired and software control unit with neat diagrams.  
**Ans.** Refer Q. 3.25.
- Q.13. What is micro-programmed control unit ? Give the basic structure of micro-programmed control unit. Also discuss the micro-instruction format and the control unit organization for a typical micro-programmed controllers using suitable diagram.  
**Ans.** Refer Q. 3.26.
- Q.14. Write a short note on micro-program sequencer for control memory.  
**Ans.** Refer Q. 3.27.

**Q.15. Briefly define the following terms :**

- Micro-operation
- Micro-instruction
- Micro-program
- Micro-code
- Control memory

Refer Q. 3.30.

**Q.16. Write an assembly level program for the following pseudo code:**

```
SUM = 0
SUM = SUM + A + B
DIF = DIF-C
SUM = SUM + DIF
```

Refer Q. 3.31.

**Q.17. Explain 4-bit incrementer with a necessary diagram.**

Refer Q. 3.32.

**Q.18. Write a program loop using a pointer and a counter to clear the contents of hex locations 500 to 5FF with 0.**

Refer Q. 3.33.

**Q.19. Demonstrate the process of second pass of assembler using a suitable diagram.**

Refer Q. 3.34.

**PART-1****Memory : Basic Concept and Hierarchy.****Questions-Answers****Long Answer Type and Medium Answer Type Questions**

**Que 4.1.** Explain concept of memory. Describe memory hierarchy.

**Answer**

**hierarchy:**

1. The memory of a computer holds (stores) program instructions (what to do), data (information), operand (manipulated or operated upon data), and calculations (ALU results).
2. The CPU controls the information stored in memory.
3. Information is fetched, manipulated (under program control) and written (or written back) into memory for immediate or later use.
4. The internal memory of a computer is also referred to as main memory, global memory, main storage.
5. The secondary or auxiliary memory (also called mass storage) is provided by various peripheral devices.

**Memory hierarchy:**

1. The memory hierarchy system consists of all storage devices employed in a computer system from the slow but high capacity auxiliary memory to a relatively faster main memory, to as even smaller and faster cache memory accessible to the high speed processing logic.
2. Fig. 4.1.1 shows the typical memory hierarchy. All the memory devices are shown in the Fig. 4.1.1.

**Computer Organization & Architecture****4-3 B (CSE/T-Sem-3)**

**Memory hierarchy is layered into these layers :**

1. **Registers :** Internal register in a CPU is used for holding variables and temporary results. Internal registers have a very small storage; however they can be accessed instantly.
2. **Cache memory :** Cache is used by the CPU for holding data in the memory which is being accessed over and over again. It acts as a buffer between the CPU and the main memory.
3. **Main memory :**
  - a. Main memory is large and fairly fast external memory which stores active data and programs.
  - b. Storage location in memory is directly addressed by the CPU's load and store instructions.
  - c. Access time is larger because of its large capacity and as it is physically separated from the CPU.
4. **Secondary/auxiliary memory :**
  - a. Secondary/auxiliary memory are giant in capacity but comparatively very slow than all the other types of memory.
  - b. It stores large data files, programs and files that will not be required continuously by the CPU.
  - c. It also acts as an overflow memory when the capacity of the main memory exceeded.

**Que 4.2.** Why is memory system of a computer organized as a hierarchy? Discuss the basic elements of a memory hierarchy.

**Answer**

1. Memory system of a computer is organized as a hierarchy to optimize the use of different types of memories and to achieve greater efficiency and economy.
2. Memory is organized in a hierarchy with the highest performance and in general the most expensive devices at the top, and with progressively lower performance and less costly devices in succeeding layers.

**Elements of memory hierarchy :** Refer Q. 4.1, Page 4-2B, Unit-4.

**PART-2****Semiconductor RAM Memories.****Questions-Answers****Long Answer Type and Medium Answer Type Questions**

**Q. 4.4.** Explain semiconductor RAM. Enlist the types of semiconductor memory.

OR

Explain dynamic RAM and static RAM.

**Answer**

#### Semiconductor RAM:

1. Semiconductor Random Access Memory (RAM) is a form of computer data storage which stores frequently used program instructions to increase the general speed of a system.
2. A random access memory device allows data items to be read or written in almost the same amount of time irrespective of the physical location of data inside the memory.

Types of semiconductor RAM are :

#### 1. DRAM:

- a. Dynamic RAM is a form of random access memory.
- b. DRAM uses a capacitor to store each bit of data, and the level of charge on each capacitor determines whether that bit is a logical 1 or 0.
- c. However these capacitors do not hold their charge indefinitely, and therefore the data needs to be refreshed periodically.
- d. DRAM is the form of semiconductor memory that is often used in equipment including personal computers and workstations where it forms the main RAM for the computer.

#### 2. SRAM:

- a. Static Random Access Memory is a semiconductor memory in which, the data does not need to be refreshed dynamically.
- b. SRAM is volatile in nature.
- c. It consumes more power, is less dense and more expensive than DRAM.
- d. SRAM is used for cache memory.

**Q. 4.5.** Give the structure of commercial 8M x 8 bit DRAM chip.

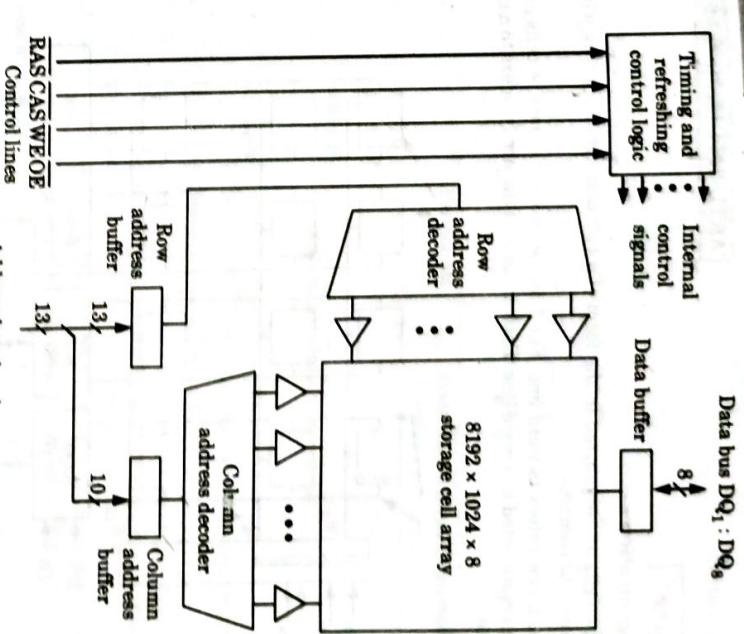

Fig. 4.4.1. Structure of a commercial 8M x 8 bit DRAM chip.

PART-3

2D & 2½ D Memory Organization.

Questions-Answers

Long Answer Type and Medium Answer Type Questions

**Que 4.5.** Explain 2D, 2½ D memory organization.

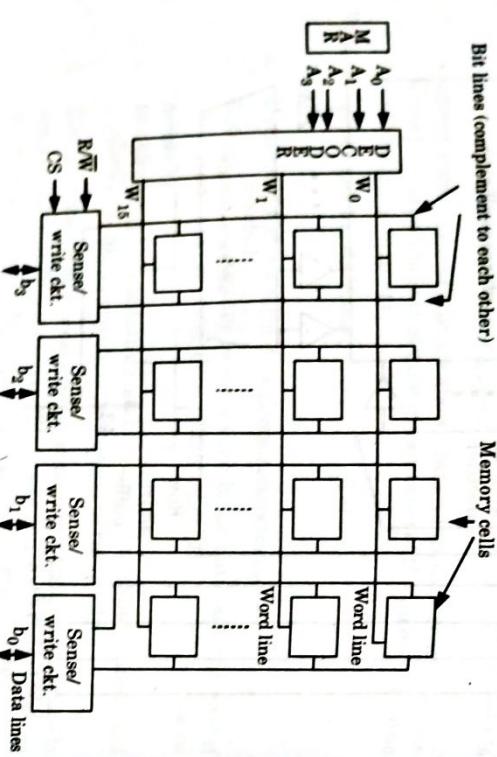

**Write short note on organization of 2D and 2.5D memory organization.**

**AKTU 2014-15, Marks: 06**

**Answer**

**2D organization :**

1. The cells are organized in the form of a two-dimensional array with rows and columns.
2. Each row refers to word line. For 4-bit per word memory, 4 cells are interconnected to a word line. Each column in the array refers to a bit line.

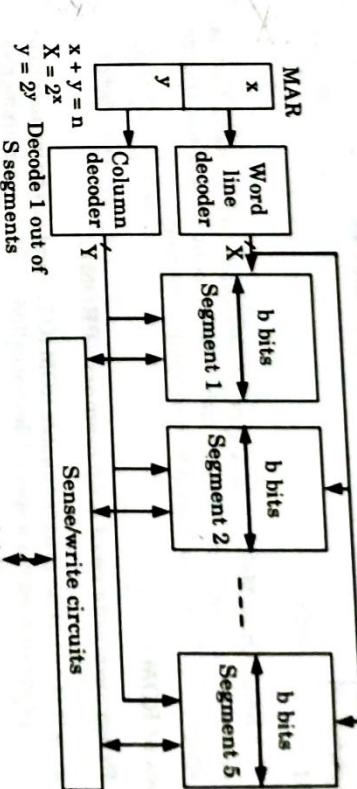

**Fig. 4.5.1. 2D organization of a memory chip of size  $16 \times 4$ .**

3. The Memory Address Register (MAR) holds the address of the location where read/write operation is executed. In Fig. 4.5.1, MAR has 4-bit lines.
4. The content of MAR is decoded by an address decoder on the chip to activate each word line.
5. The cells in each column are connected to a sense/write circuit by two bit lines. Two bit lines are complement to each other.
6. The sense/write circuits are activated by the Chip Select (CS) lines.
7. During a read operation, these circuits sense or read the information stored in the cells selected by a word line and transmit this information to the data lines.

8. During a write operation, the sense/write circuits receive or write input information from the data lines and store it in the selected cells.

**2.5D organization :**

**Fig. 4.5.2. 2.5D organization.**

1. In 2.5D organization there exists a segment.
2. The content of MAR is divided into two parts - x and y number of bits.
3. The number of segments  $S$  is equal to  $2^y$ .
4.  $X = 2^x$  drive lines are fed into the cell array and  $y$  number of bits decode one bit line out of  $S$  lines fed into a segment of the array. In total, there are  $Sb$  number of bit lines for a  $b$  bit per word memory.
5. Thus for any given address in the MAR, the column decoder decodes  $b$  out of  $Sb$  bit lines by using the  $y$  bits of the MAR while a particular word line is activated by using the  $x$  bits.
6. Thus only the  $b$  numbers of bits in the array are accessed by enabling the word line and  $b$  number of bit lines simultaneously.
7. Though 2.5D organized memory may need lesser chip decoding logic, it suffers from one drawback. With high density chips, a simple failure, such as external pin connection opening or a failure on one bit can render the entire chip inoperative.

**PART-4**  
**ROM Memories.**

**Questions-Answers**

**Long Answer Type and Medium Answer Type Questions**

**Que 4.6. What is ROM ? Explain the types of ROM.****OR****Explain the semiconductor based ROM memories.****Answer****ROM:**

- The Read Only Memory is a type of semiconductor memory that is designed to hold data that is either permanent or will not change frequently. It is also known as non-volatile memory.

**Types of ROM:****i. Programmable read only memory (PROM) :**

- It is one-time programmable ROM (OTP) and can be written to or programmed via a special device called a PROM programmer.
- Typically, this device uses high voltages to permanently destroy or create internal links (fuses or antifuses) within the chip.
- Consequently, a PROM can only be programmed once.

**ii. Erasable programmable read only memory (EPROM) :**

- It can be erased by exposure to strong ultraviolet light (typically for 10 minutes or longer), then rewritten with a process that again requires application of higher than usual voltage.
- Repeated exposure to UV light will eventually wear out an EPROM, but the endurance of most EEPROM chips exceeds 1000 cycles of erasing and reprogramming.
- EPROM chip packages can often be identified by the prominent quartz "window" which allows UV light to enter.

- After programming, the window is typically covered with a label to prevent accidental erasure.

- Some EEPROM chips are factory-erased before they are packaged, and include no window, these are effectively PROM.

**iii. Electrically erasable programmable read only memory (EEPROM) :**

- It is based on a similar semiconductor structure to EEPROM, but allows its entire contents (or selected banks) to be electrically erased, then rewritten electrically, so that they need not be removed from the computer (or camera, MP3 player, etc.).

- b. Writing or flashing an EEPROM is much slower (milliseconds per bit) than reading from a ROM or writing to a RAM (nanoseconds in both cases).

**iv. Mask programming :**

- It is done by the company during fabrication process of the unit.
- The procedure for fabricating a ROM requires that the customer fills out the truth table he wishes the ROM to satisfy.

**Que 4.7. How main memory is useful in computer system ?**  
**Explain the memory address map of RAM and ROM.****AKTU 2016-17, Marks 15****Answer**  
**Main memory is useful in computer system :**

- The main memory occupies a central position in a computer system.
- It is able to communicate directly with the CPU and with auxiliary memory devices through an I/O processor.
- It is relatively large and fast.

**Memory address map of RAM and ROM :**

- Memory address map is a pictorial representation of assigned address space for each chip in the system.
- To demonstrate with a particular example, assume that a computer system needs 512 bytes of RAM and 512 bytes of ROM.
- The RAM and ROM chips to be used are specified in Fig. 4.7.1. The memory address map for this configuration is shown in Table 1.
- The component column specifies whether a RAM or a ROM chip is used. The hexadecimal address column assigns a range of hexadecimal equivalent addresses for each chip. The address bus lines are listed in the third column.
- The selection between RAM and ROM is achieved through bus line 10. The RAMs are selected when the bit in this line is 0, and the ROM when the bit is 1.

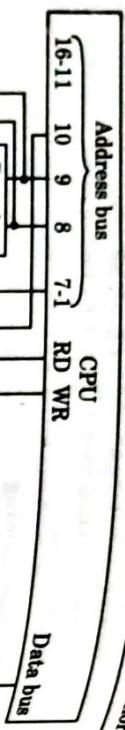

Fig. 4.7.1.

Table 4.7.1: Memory address map.

Component	Hexadecimal Address	Address bus
RAM1	0000-007F	10 9 8 7 6 5 4 3 2 1
RAM2	0080-00FF	0 0 0 x x x x x x x x
RAM3	0100-017F	0 1 0 x x x x x x x x
RAM4	0180-01FF	0 1 1 x x x x x x x x
ROM	0200-03FF	1 x x x x x x x x x x

**Computer Organization & Architecture****4-11 B (CS/IT-Sem-3)**

- i. How many chips are needed and how should their address lines be connected to provide a memory capacity of  $1024 \times 8$ ?  
ii. How many chips are needed to provide a memory capacity of 16 KB? Explain in words how the chips are to be connected to the address bus.

**Answer** A computer uses RAM chips of  $1024 \times 1$  capacity.

- i. Available size of RAM chips =  $1024 \times 1$   
Required memory capacity =  $1024$  bytes  
Number of chips required =  $\frac{1024 \times 8}{1024 \times 1} = 8$  chips

So, 8 chips are needed with address line connected in parallel.

- ii. To provide a memory capacity of 16K bytes, chips required are  $16 \times 8 = 128$  chips

Number of address line for  $16K = 14$  ( $16K = 2^{14}$ )

So, 14 lines to specify chip address.

- Que 4.9.** A ROM chip of  $1024 \times 8$  has four select inputs and operates from a 5 volt power supply. How many pins are needed for the IC package? Draw a block diagram and label all input and output terminals in the ROM.

**AKTU 2016-16, Marks 10**

**Computer Organization & Architecture****4-11 B (CS/IT-Sem-3)**

- Size of ROM Chip =  $1024 \times 8$   
Number of input = 10 pin [ $2^{10} = 1024$ ]  
Number of output = 8 pin  
Number of chip select = 4 pin  
Power = 2 pin  
Total 24 pins are required.

**Answer**

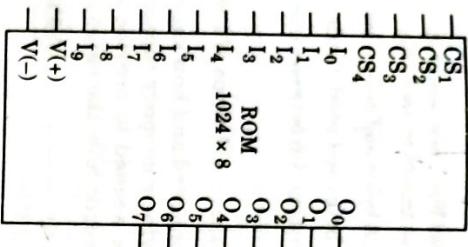

Fig. 4.9.1.

**Que 4.10.** A computer uses a memory unit with 256 K words of 32 bits each. A binary instruction code is stored in one word of memory. The instruction has four parts: an indirect bit, an operation code, a register code part to specific one of 64 register and an address part.

- How many bits are there in the operation code, the register code part and the address part?
- Draw the instruction word format and indicate the number of bits in each part.
- How many bits are there in the data and address inputs of the memory?

**AKTU 2018-19, Marks 07**

**Answer**

a. Address :  $2^8 * 2^{10} = 2^{18} = 18$  bits

Register : 64 registers =  $2^6 = 6$  bits

OP code : (Total bit - Indirect bit - Address bit - Register bit) =  $(32 - 1 - 18 - 6)$  bits = 7 bits

b. 

1	OP	Register	Address
31	30	23	17
31	30	23	17
0	0	0	0

- Number of bit in address inputs : 18
- Number of bit in data inputs : 32

**Cache Memories : Concept and Design Issues and Performance.**

**PART-5**

**Que 4.11.** Write short note on cache memory.

**Answer**

Cache memory is a small-sized type of volatile computer memory that provides high-speed data access to a processor and stores frequently used computer programs, applications and data.

- It stores and retains data only until a computer is powered up.
- Cache memory provides faster data storage and access by storing an instance of programs and data routinely accessed by the processor.
- Thus, when a processor requests data that already has an instance in the cache memory, it does not need to go to the main memory or the hard disk to fetch the data.
- Cache memory can be primary or secondary cache memory, where primary cache memory is directly integrated or closest to the processor.
- In addition to hardware-based cache, cache memory also can be a disk cache, where a reserved portion on a disk stores and provide access to frequently accessed data/applications from the disk.

**Que 4.12.** Discuss the design issues in cache design.

**Answer**

The primary elements having strong influence on cache design are :

- Cache size : There are two important factor in deciding cache size at the time of its design.
  - Size should be small enough so that its cost is very close to the main memory.
  - Size should be large enough so that most of the memory reference should be available in the cache so that average access time will be close to cache alone.
- Block size :
  - Block size of cache is an important factor in cache performance.
  - Larger block size could store the desired word as well as some adjacent word also. As a result hit ratio will increase automatically.
  - A small block size result in frequent replacement of data shortly after it is fetched increasing the overhead in cache operation.

- d. As the block size increases from smaller to larger, the hit ratio will increase first and on increasing the block size further the hit ratio began to decrease.

iii. **Associativity :** It is a basic tradeoff between parallel searching versus constraints on which addresses can be stored.

iv. **Write strategy :** Its main concern is related to when do we write cache contents to main memory.

**Ques 4.13.** How the performance of cache memory is measured?

**Answer**

1. The performance of cache memory is frequently measured in terms of a quantity called hit ratio.
2. When the CPU refers to memory and finds the word in cache, it is said to produce a hit.
3. If the word is not found in cache, it is in main memory and it counts as a miss.
4. The ratio of the number of hits divided by the total CPU references to memory (hits plus misses) is the hit ratio.
5. The hit ratio is best measured experimentally by running representative programs in the computer and measuring the number of hits and misses during a given interval of time.

**PART-6**

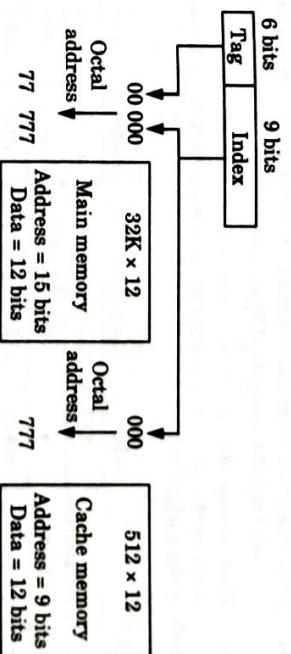

*Address Mapping and Replacement.*

**Cache mapping:**

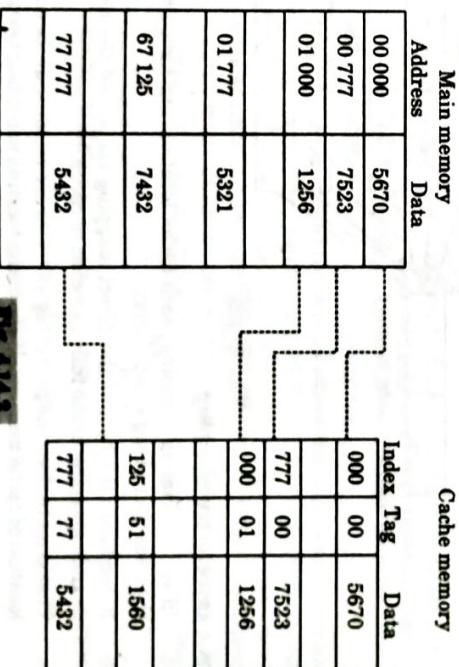

1. Cache mapping is the method by which the contents of main memory are brought into the cache and referenced by the CPU. The mapping method used directly affects the performance of the entire computer system.
2. Mapping is a process to discuss possible methods for specifying where memory blocks are placed in the cache. Mapping function dictates how the cache is organized.

**Types of mapping:**

1. **Direct mapping:**
  - a. The direct mapping technique is simple and inexpensive to implement.

**Fig 4.141.**

**Fig 4.142.**

**Ques 4.14.** What is meant by cache mapping? What are different types of mapping? Discuss different mapping techniques with examples.

**Discuss the various types of address mapping used in cache memory.**

OR

**AKTU 2017-18, Marks 07**

- b. When the CPU wants to access data from memory, it places an address. The index field of CPU address is used to access address.
- c. The tag field of CPU address is compared with the associated tag in the word read from the cache.
- d. If the tag-bits of CPU address are matched with the tag-bits of cache, then there is a hit and the required data word is read from cache.
- e. If there is no match, then there is a miss and the required data word is stored in main memory. It is then transferred from main memory to cache memory with the new tag.

### 2. Associative mapping :

- a. An associative mapping uses an associative memory.
- b. This memory is being accessed using its contents.
- c. Each line of cache memory will accommodate the address (main memory) and the contents of that address from the main memory.
- d. That is why this memory is also called Content Addressable Memory (CAM). It allows each block of main memory to be stored in the cache.

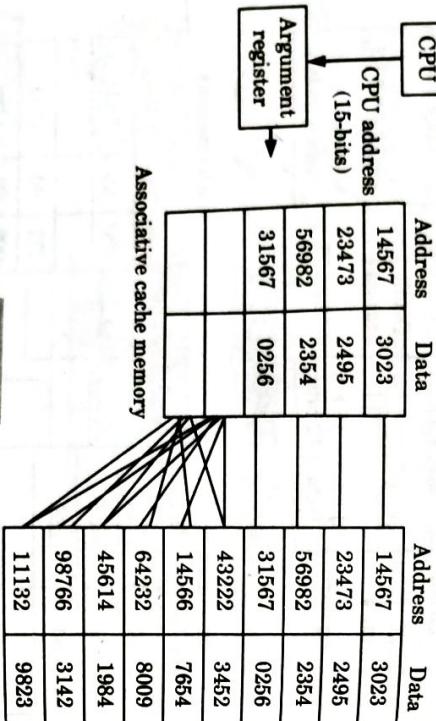

Fig. 4.143.

Main memory

### 3. Set associative mapping :

- a. In set associative mapping, each cache location can have more than one pair of tag + data items.
- b. It combines the best of the direct mapping cache and the more flexible mapping of the fully associative cache.
- c. There is more than one pair of tag and data are residing at the same location of cache memory. If one cache location is holding two pair of tag + data items, that is called 2-way set associative mapping.

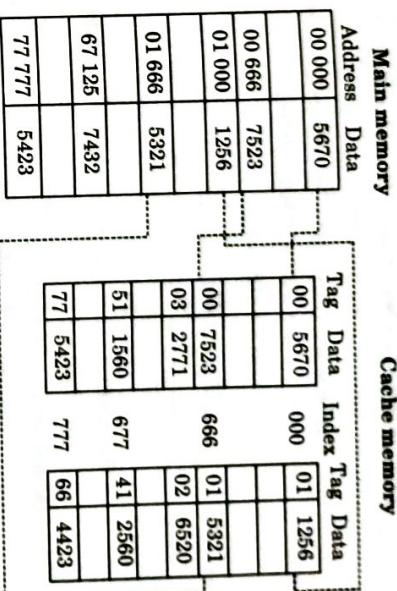

Fig. 4.144.

**Ques 4.15.** What do you mean by cache memory? How does it affect the performance of the computer system? An eight-way set associative cache is used in computer in which the real memory size  $2^{32}$  bytes. The line size is 16 bytes, and there are  $2^{10}$  lines per set. Calculate the cache size and tag length.

### Answer

**Cache memory :** Refer Q. 4.11, Page 4-13B, Unit-4.

- Cache affect the performance as follows :**
1. The CPU to work at its maximum efficiency, the data transfer from the other hardware must be as fast as its speed. The purpose of a cache is to ensure this smooth and fast transition of data transfer from the hardware to the CPU.
  2. As CPU speed increased to the point where the RAM is no longer able to catch up, the transferring of information again become a serious problem. To solve this issue, a cache, which was effectively a small and extremely fast memory, was added to the processor to store immediate instruction from the RAM. Since the cache runs at the same speed of the CPU, it can rapidly provide information to the CPU at the shortest time without any delay.

### Numerical :

Given, Main memory size =  $2^{32}$  bytes =  $2^{35}$  bits

Line size = Block size = 16 bytes =  $2^7$  bits

Lines/set =  $2^{10}$

Since, 8-way set associative so, cache have 8 set

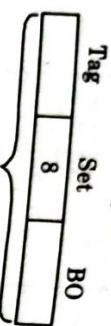

No. of set = 8

$$\begin{aligned}\text{Total no. of lines} &= \text{No. of sets} \times \text{No. of lines/set} \\ &= 8 \times 2^{10} = 2^{13}\end{aligned}$$

Cache size = No. of sets  $\times$  No. of lines/set;

$$= 8 \times 2^{13} \times 2^7 \text{ bits} = 2^{23} \text{ bits}$$

Cache size = 8 MBytes

Block offset =  $\log_2$  (line size)

$$\text{No. of set} = 8$$

Physical address (PA) = 35

$$\text{Tag size} = \text{PA} - (\text{Block offset} + \text{No. of set})$$

$$= 35 - (7 + 8)$$

$$\text{Tag size} = 20 \text{ bit}$$

**Que 4.16.**

Consider a cache uses a direct mapping scheme. The size of main memory is 4 K bytes and word size of cache is 2 bytes.

- The size of main memory address (assume each byte of main memory has an address)
- Address of cache block
- How many memory location address will be translated to cache address/block/location?
- How can it be determined if the content of specified main memory address in cache?

**Answer** AKTU 2014-15, Marks 10

Given, Size of main memory = 4 K bytes

Size of cache memory = 128 bytes

Word size of cache = 2 bytes

i. Size of main memory address:

Since, size of main memory = 4 K bytes =  $2^{12}$  bytes

- Address of cache block:  
Since, size of cache memory = 128 bytes  
Block size = word size of cache = 2 bytes
- Number of lines =  $\frac{128}{2} = 64$

### Computer Organization & Architecture

### 4-19 B (CSIT-Sem-3)

So, address of cache block is from 0 to 63

iii. Since, size of main memory = 4 K bytes = 4096 bytes

So, number of block in main memory = 4096

and number of block in cache = 64

and each block of cache = 2 bytes

So,  $\left(\frac{4096}{(64 \times 2)}\right) = 32$  memory location address will be translated to cache address/block/location.

- We can determine the content of specified main memory address in cache using this :
- $i \bmod 2^k$

where,  
 $i$  = particular memory address  
 $k$  = line number

**Answer** AKTU 2018-19, Marks 07

**Que 4.17.** A two way set associative cache memory uses blocks of 4 words. The cache can accommodate a total of 2048 words from memory. The main memory size is 128 K  $\times$  32.

- Formulate all pertinent information required to construct the cache memory.
- What is the size of the cache memory?

**Answer** AKTU 2018-19, Marks 07

- Main memory size =  $128K \times 32 = 2^{17}$   
Cache size = 2048 words

Set size of 2 cache can accommodate =  $2048/2 = 1024$  words of cache

Block size = 4 words

7-bit TAG INDEX

8-bit 2-bit

- Size of cache memory =  $1024 \times 2 (7 + 32) = 1024 \times 78$

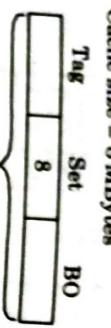

- Que 4.18.** What is the distinction between spatial locality and temporal locality?  
AKTU 2018-19, Marks 7.5

No. of set = 8

$$\begin{aligned} \text{Total no. of lines} &= \text{No. of sets} \times \text{No. of lines/set} \\ &= 8 \times 2^{10} = 2^{13} \end{aligned}$$

Cache size = No. of sets  $\times$  No. of lines/ $\text{set} \times$  size of line

$$\begin{aligned} &= 8 \times 2^{13} \times 2^7 \text{ bits} = 2^{23} \text{ bits} \\ \text{Cache size} &= 8 \text{ MBytes} \end{aligned}$$

Block offset =  $\log_2$  (line size) =  $\log_2 (2^7) = 7$  bits

No. of set = 8  
Physical address (PA) = 35

$$\begin{aligned} \text{Tag size} &= \text{PA} - (\text{Block offset} + \text{No. of set}) \\ &= 35 - (7 + 8) \end{aligned}$$

$$\begin{aligned} \text{Tag size} &= 20 \text{ bit} \\ \text{Block offset} &= 7 \text{ bit} \end{aligned}$$

**Que 4.16.**

Consider a cache uses a direct mapping scheme. The size of main memory is 4 K bytes and word size of cache is 2 bytes. The size of cache memory is 128 bytes. Find the following:

- The size of main memory address (assume each byte of main memory has an address)
- Address of cache block
- How many memory location address will be translated to cache address/block/location?
- How can it be determined if the content of specified main memory address in cache?

**AKTU 2014-15, Marks 10**

**Answer**

Given, Size of main memory = 4 K bytes

Size of cache memory = 128 bytes

Word size of cache = 2 bytes

i. **Size of main memory address :**

Since, size of main memory = 4 K bytes =  $2^{12}$  bytes

So, the size of main memory address = 12

ii. **Address of cache block :**

Since, size of cache memory = 128 bytes

Block size = word size of cache = 2 bytes

$$\text{Number of lines} = \frac{128}{2} = 64$$

So, address of cache block is from 0 to 63

iii. Since, size of main memory = 4 K bytes = 4096 bytes  
So, number of block in main memory = 4096

and number of block in cache = 64  
and each block of cache = 2 bytes

So,  $\left(\frac{4096}{64 \times 2}\right) = 32$  memory location address will be translated to cache address/block/location.

- iv. We can determine the content of specified main memory address in cache using this:

$$\begin{aligned} i \bmod 2^k \\ \text{where, } i = \text{particular memory address} \\ k = \text{line number} \end{aligned}$$

**Que 4.17.**

A two way set associative cache memory uses blocks of 4 words. The cache can accommodate a total of 2048 words from memory. The main memory size is 128 K  $\times$  32.

- Formulate all pertinent information required to construct the cache memory.
- What is the size of the cache memory?

**AKTU 2018-19, Marks 07**

**Answer**

i. Main memory size = 128K  $\times$  32 =  $2^{17}$

Cache size = 2048 words

Set size of 2 cache can accommodate =  $2048/2 = 1024$  words of cache

Block size = 4 words

$$\begin{aligned} \text{ii.} \\ \text{Size of cache memory} &= 1024 \times 2^{(7+32)} = 1024 \times 78 \end{aligned}$$

**Que 4.18.** What is the distinction between spatial locality and temporal locality?

**AKTU 2018-19, Marks 07**

**Answer****Difference:**

S.No.	<b>Spatial locality</b>	<b>Temporal locality</b>
1.	Spatial locality refers to the tendency of execution to involve a number of memory locations that are clustered.	Temporal locality refers to the tendency for a processor to access memory locations that have been used recently.
2.	The spatial locality means that instructions stored nearest to the recently executed instructions are also likely to be executed soon.	The temporal locality means that a recently executed instruction is likely to be executed again very soon.
3.	The spatial aspect suggests that instead of bringing just one item from the main memory to the cache, it is wise to bring several items that reside at adjacent addresses as well.	The temporal aspect of the locality reference suggests that whenever information of instruction and data is first needed, this information should be brought into cache where it will hopefully remain until it is needed again.

**Que 4.19. Write short note on write through and write back policy of cache memory.****Answer****Writing policy of cache memory :**

- Write through :**
  - This is simplest technique.
  - Using this technique, all write operations are made to main memory as well as to the cache, ensuring that main memory is always valid.
  - The main disadvantage of this technique is that it generates substantial memory traffic and may create a bottleneck.
- Write back :**
  - It is another technique which minimizes memory writes.
  - With write back, updates are made only in the cache.
  - When an update occurs, an UPDATE bit associated with the slot is set. Then, when a block is replaced it is written back to main memory if and only if the UPDATE bit is set.

- d. The problem with write back is that portions of main memory are invalid and hence accesses by I/O modules can be allowed only through the cache.

**Que 4.20. Explain replacement algorithm in brief.****Answer**

When a main memory block needs to be brought in while all the cache memory blocks are occupied, one of them has to be replaced. This is known as block replacement.

The replacement algorithms are given as follows :

- Optimal replacement :**

- In this policy, replace the block which is no longer needed in the future.
- If all blocks currently in cache memory will be used again, replace the one which will not be used in the future for the longest time.
- The optimal replacement is obviously the best but is not realistic, simply because when a block will be needed in the future is usually not known ahead of time.

- LRU (Least Recently Used) :**

- In this policy, replace the block in cache memory that has not been used for the longest time, i.e., the least recently used (LRU) block.
- The LRU is sub-optimal based on the temporal locality of reference, i.e., memory items that are recently referenced are more likely to be referenced soon than those which have not been referenced for a longer time.

- FIFO (First in First Out) :**

- In this policy, replace the block that has been in cache memory for the longest time.
- FIFO is simplest replacement algorithm than LRU.

- Random selection :**

- In this policy, replace a randomly selected block among all blocks currently in cache memory.
- In random selection, select the block and discard it to make space when necessary.

**PART-7**

**Questions-Answers**

**Long Answer Type and Medium Answer Type Questions**

**Que 4.21.** Explain auxiliary memory. What are the commonly used auxiliary memory?

**Answer**

1. Auxiliary memory is a higher capacity external memory.
2. It is non-volatile memory that is not accessible by the CPU, because it is not accessed via the input / output channels.

**Types of auxiliary memory :**

1. **Magnetic disks :**
  - a. A disk is a circular plate constructed of metal or of plastic coated with a magnetizable material.
  - b. Data are recorded on and later retrieved from the disk via a conducting coil, named the head.
  - c. During a read and write operation, the head is stationary while the plate rotates beneath it.
2. **Magnetic tape :**
  - a. A magnetic tape consists of the electrical, mechanical and electronic components to provide the parts and control mechanism for a magnetic tape unit.
  - b. The tape itself is a strip of plastic coated with a magnetic recording medium.
  - c. Bits are recorded as magnetic spots on the tape along several tracks.
  - d. Usually, seven or nine bits are recorded simultaneously to form a character together with a parity bit.
  - e. Read/write heads are mounted one in each track so that data can be recorded and read as sequence of characters.

**3. Flash memory :**

- a. An electronic non-volatile computer storage device that can be electrically erased and reprogrammed, and works without any moving parts.
- b. Examples of this are flash drives, memory cards and solid state drives.

**4. Optical disk :**

- a. A storage medium from which data is read and written by lasers.

- b. Optical disks can store much more data up to 6 gigabytes more than most portable magnetic media, such as floppies.
- c. There are three basic types of optical disks: CD/DVD/BD-ROM (read-only), WORM (write-once read-many) & EO (erasable optical disks).

**Que 4.22.** A moving arm disc storage device has the following specifications:

Number of Tracks per recording surface = 200

Disk rotation speed = 2400 revolution/minute

Track-storage capacity = 62500 bits

Estimate the average latency and data transfer rate of this device.

**AKTU 2017-18, Marks 07**

**Answer**

Disk rotation speed = 2400 rpm

As we know that average latency =  $\frac{1}{2} \times$  Rotation time

$$\therefore 2400 \text{ rotation in one minute so the time for one rotation} = \frac{1}{2} * \frac{60}{2400} \text{ s}$$

$$= \frac{3}{240} \text{ s}$$

$$= 12.5 \text{ ms}$$

Track storage capacity = 62500 bits

And in one rotation head cover entire track, so, disk transfer rate

$$= 62500 * \frac{2400}{60} \text{ s}$$

(where 2400/60 is number of rotations per second)

$$= 2.5 * 10^6 \text{ bps}$$

**Que 4.23.** What is virtual memory ?

**OR**

Write a short note on virtual memory. **AKTU 2014-15, Marks 05**

**Answer**

1. Virtual memory is a memory management capability of an OS that uses hardware and software to allow a computer to compensate for physical memory shortages by temporarily transferring data from Random Access Memory (RAM) to disk storage.

2. Virtual address space is increased using active memory in RAM and inactive memory in Hard Disk Drives (HDDs) to form contiguous addresses that hold both the application and its data.
  3. A system using virtual memory can load larger programs or multiple programs running at the same time, allowing each one to operate as if it has infinite memory and without having to purchase more RAM.
  4. Virtual memory is a facility that allows program to address memory from local point of view, without regard to the amount of main memory.
  5. A virtual memory system provides a mechanism for translating program generated addresses into correct main memory locations.
  6. This is done dynamically, while programs are being executed in the CPU.
- Ques 4.24** Explain the following memory schemes discussing why needed the:
- i. Interleaved memory
  - ii. Associative memory
- OR**
- Explain the working principle of associative memory.**

**Answer**

- i. Interleaved memory :**

1. Interleaved memory is a design made to compensate for the relatively slow speed of Dynamic Random Access Memory (DRAM).

2.

This is done by spreading memory addresses evenly across memory banks.

3. Thus, in contiguous memory, reads and writes are done using each memory bank in turn, resulting in higher memory throughputs due to reduced waiting for memory banks to become ready for desired operations.

4. As shown in Fig. 4.24.1, the lower order  $k$  bits of the address are used to select the module (Memory bank) and higher order  $m$  bits give a unique memory location in the memory bank that is selected by the lower order  $k$  bits.

5. Thus in this way consecutive memory locations are stored on different memory banks.

6. Whenever requests to access consecutive memory locations are being made several memory banks are kept busy at any point in time.

7. This results in faster access to a block of data in the memory and also results in higher overall utilization of the memory system as a whole.

- ii. Associative memory :**
1. Associative memory is a memory in which location is accessed by a field of data word stored in the memory rather than by any address.
  2. It can be viewed as a random access type memory which in addition to having a physically wired-in addressing mechanism also has wired-in logic for bit comparison.
  3. This logic circuit enables comparison of desired bit positions of all the words with a specified input key.
  4. This comparison is done simultaneously for all the words.
  5. This is also called Content Addressable Memory (CAM).

**Working principle of associative memory :**

1. The mask register specifies the key field.
2. Input data is simultaneously compared with the key field of each word.
3. The select circuit implements two functions :
  - a. It stores the word location ( $s$ ) for which match has occurred.
  - b. It reads out the word(s) in predetermined order for the match position ( $s$ ).
4. Thus, a word stored in the associative memory is a pair (key, Data). Any subfield of the word can be specified as the key.
5. The read or write instruction is preceded by the match instruction having the format.
6. The read/write operation can next be performed on each of the words for which match signal is generated.

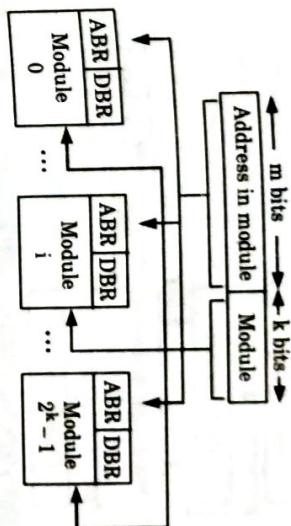

Fig. 4.24.1.

8. If  $k$  bits are allotted for selecting the bank as shown in the Fig. 4.24.1, there have to be total  $2^k$  banks. This ensures that there are no gaps of non-existent memory locations.

**Working principle of associative memory :**

1. Associative memory is a memory in which location is accessed by a field of data word stored in the memory rather than by any address.
2. It can be viewed as a random access type memory which in addition to having a physically wired-in addressing mechanism also has wired-in logic for bit comparison.
3. This logic circuit enables comparison of desired bit positions of all the words with a specified input key.
4. This comparison is done simultaneously for all the words.
5. This is also called Content Addressable Memory (CAM).

- Ques 4.24** Explain the following memory schemes discussing why needed the:
- i. Interleaved memory
  - ii. Associative memory
- OR**
- Explain the working principle of associative memory.**

**Answer**

- i. Interleaved memory :**

1. Interleaved memory is a design made to compensate for the relatively slow speed of Dynamic Random Access Memory (DRAM).

2.

This is done by spreading memory addresses evenly across memory banks.

3. Thus, in contiguous memory, reads and writes are done using each memory bank in turn, resulting in higher memory throughputs due to reduced waiting for memory banks to become ready for desired operations.

4. As shown in Fig. 4.24.1, the lower order  $k$  bits of the address are used to select the module (Memory bank) and higher order  $m$  bits give a unique memory location in the memory bank that is selected by the lower order  $k$  bits.

5. Thus in this way consecutive memory locations are stored on different memory banks.

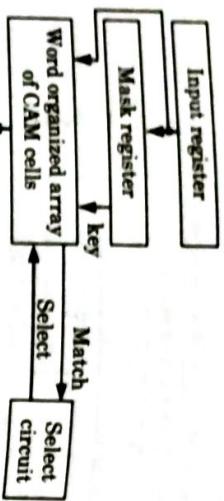

6. Whenever requests to access consecutive memory locations are being made several memory banks are kept busy at any point in time.

7. This results in faster access to a block of data in the memory and also results in higher overall utilization of the memory system as a whole.

**Computer Organization & Architecture**

**The major characteristics are :**

1. This memory is accessed simultaneously and in parallel on the basis of data content rather than by specific address or location.
2. This memory is capable of finding an empty unused location to store the word.
3. This memory is uniquely suited to do parallel searches by data association.
4. Each cell must have storage capability as well as logic circuits for matching its content with an external argument.

**Fig. 4.24.2. Organization of an associative memory**

**Que 4.25.** What is associative memory ? Explain with the help of a block diagram. Also mention the situation in which associative memory can be effectively utilized.

**AKTU 2018-19, Marks 07**

**Answer**

**Associative memory and block diagram :** Refer Q. 4.24, Page 4-24B, Unit-4.

Associative memory is effectively utilized when doing a large number of pattern match and lookup.

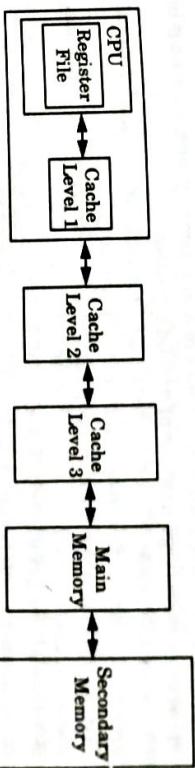

**Que 4.26.** What do you mean by CAM ? Explain its major characteristics.

**AKTU 2015-16, Marks 10**

**Answer**

**CAM:**

1. Content Addressable Memory (CAM) is computer memory that operates like a hardware search engine for search-intensive applications.
2. CAM is capable of searching its entire contents in a single clock cycle.
3. It does that by pairing the SRAM-based memory with additional logic comparison circuitry that is active on every clock cycle.
4. The way CAM functions is almost the opposite of Random Access Memory (RAM).
5. Data stored on CAM, can be accessed by searching for the content itself, and the memory retrieves the addresses where that content can be found.
6. Because of its parallel nature, CAM is much faster than RAM for searching.

**Fig. 4.27.1. Conceptual organization of multilevel memories in a computer system.**

1. **CPU registers :**
  - a. The high-speed registers in CPU are used as the temporary storage for instructions and data.
  - b. They usually form a general purpose register file for storing data as it is processed. A capacity of 32 data words is typical for a register file and each register can be accessed within a single clock cycle that is in a few nano seconds.
2. **Cache memory :**
  - a. Cache memory is positioned logically between register files and the main memory.
  - b. Its capacity is less than main memory but access time is much lesser, that is this types of memories are much faster than the main memory.
3. **It operates in three levels :**
  - a. Level 1 (L1) cache : It is built directly into the processor chip. It has small capacity from 8 kb to 128 kb.

- b. **Level 2 (L2) cache :** It is built on current processors on processor chip. It has capacity from 64 kb to 16 MB.
- c. **Level 3 (L3) cache :** This cache is separate from processor chip on the motherboard. Its capacity is up to 8 MB.

3. **Main or primary memory :** Refer Q. 4.1, Page, Unit-4.
4. **Secondary memory :** Refer Q. 4.1, Page, Unit-4.

**Ques 4.28.** What do you mean by locality of reference ? Explain with suitable example.

**Answer**

Locality of reference is a term for the phenomenon in which the same values or related storage locations are frequently accessed, depending on the memory access pattern.

**Example :**

- Take the example of an operating system. Ideally, we would like an unlimited amount of main memory, instantly accessible.
- In practice, we have a limited amount of main memory, and because it is cheaper, a very large amount of secondary memory.
- However, the trade-off is that secondary memory tends to be several orders of magnitude slower than primary memory.
- We can approach the ideal by keeping the more often used data in main memory, and everything else in secondary memory.
- Because of the principle of Locality of Reference, we can be sure that most memory references will be to locations already stored in main memory, thereby improving efficiency and providing a flat memory model.
- This scheme is used in modern operating systems and is called virtual memory. Virtual memory gives users the appearance of unlimited primary memory by transparently utilizing secondary memory.

**VERY IMPORTANT QUESTIONS**

*Following questions are very important. These questions may be asked in your SESSIONALS as well as UNIVERSITY EXAMINATION.*

- Q. 3.** How main memory is useful in computer system ? Explain the memory address map of RAM and ROM.
- Refer Q. 4.7.

- Q. 4.** A computer uses RAM chips of  $1024 \times 1$  capacity.
- How many chips are needed and how should their address lines be connected to provide a memory capacity of  $1024 \times 8$  ?
  - How many chips are needed to provide a memory capacity of 16 KB ? Explain in words how the chips are to be connected to the address bus.

Refer Q. 4.8.

- Q. 5.** A ROM chip of  $1024 \times 8$  has four select inputs and operates from a 5 volt power supply. How many pins are needed for the IC Package ? Draw a block diagram and label all input and output terminals in the ROM.

Refer Q. 4.9.

- Q. 6.** A computer uses a memory unit with 256 K words of 32 bits each. A binary instruction code is stored in one word of memory. The instruction has four parts : an indirect bit, an operation code, a register code part to specific one of 64 register and an address part.

- How many bits are there in the operation code, the register code part and the address part ?
- Draw the instruction word format and indicate the number of bits in each part.
- How many bits are there in the data and address inputs of the memory ?

Refer Q. 4.10.

- Q. 7.** Discuss the various types of address mapping used in cache memory.

Refer Q. 4.14.

- Q. 8.** Consider a cache uses a direct mapping scheme. The size of main memory is 4 K bytes and word size of cache is 2 bytes. The size of cache memory is 128 bytes. Find the following :

- The size of main memory address (assume each byte of main memory has an address)
- Address of cache block
- How many memory location address will be translated to cache address/block/location ?
- How can it be determined if the content of specified main memory address in cache ?

- Q. 1.** Give the structure of commercial  $8M \times 8$  bit DRAM chip.  
Ans. Refer Q. 4.4.
- Q. 2.** Write short note on organization of 2D and 2.5D memory organization.  
Ans. Refer Q. 4.5.

Q. 9. A two way set associative cache memory uses blocks of 4 words. The cache can accommodate a total of 2048 blocks of 4 from memory. The main memory size is  $128 \text{ K} \times 32$ .

- Formulate all pertinent information required to construct the cache memory.
- What is the size of the cache memory ?

**ANS:** Refer Q. 4.17.

Q. 10. What is the distinction between spatial locality and temporal locality ?

**ANS:** Refer Q. 4.18.

Q. 11. A moving arm disc storage device has the following specifications :

Number of Tracks per recording surface = 200

Disc rotation speed = 2400 revolution/minute

Track-storage capacity = 62500 bits

Estimate the average latency and data transfer rate of this device.

**ANS:** Refer Q. 4.22.

Q. 12. Write a short note on virtual memory.

**ANS:** Refer Q. 4.23.

Q. 13. Explain the following memory schemes discussing why needed the:

- Interleaved memory
- Associative memory

**ANS:** Refer Q. 4.24.

Q. 14. What is associative memory ? Explain with the help of a block diagram. Also mention the situation in which associative memory can be effectively utilized.

**ANS:** Refer Q. 4.25.

Q. 15. What do you mean by CAM ? Explain its major characteristics.

**ANS:** Refer Q. 4.26.

Q. 16. What do you mean by locality of reference ? Explain with suitable example.

**ANS:** Refer Q. 4.28.

### Questions-Answers

### Long Answer Type and Medium Answer Type Questions

### PART - 1

### InputOutput

- c. **Status reporting :** The device must be able to report its status to the processor. For example, disk drive busy, ready etc.
- d. Status reporting may also involve reporting various errors.
- e. **Address recognition :** Each I/O device has a unique address and the I/O module must recognize this address.

- Que 5.1.** Explain the term peripheral devices.

#### Answer

1. Peripheral devices are the computer devices that are connected to the computer externally such as printer, scanner, keyboard, mouse, tape device, microphone and external modem. It can be internal such as CD-ROM or internal modem.
2. Peripheral devices can be classified according to their functions :
  - i. **Input :** Input devices are the type of computer devices that are used to provide the control signals to the computer. Keyboard and mouse are the examples of the input devices.
  - ii. **Output :** Output devices are the devices that are used to display the results. Printer, scanner, speaker and the monitor are the examples of the output devices.
  - iii. **Storage :** A storage device is a device that is used to store the information such as hard-disk drive, flash drive, floppy disk and the tape drive.

- Que 5.2.** Describe I/O interface. Why they are needed ?

OR

- Why input-output interface is required ? Describe in detail.

**AKTU 2015-16, Marks 15**

#### Answer

I/O interface provides a method of transferring information between internal storage and external I/O devices.

The major requirements for an I/O module can be given as :

1. **Processor communication :** This involves the following tasks :
  - a. Exchange of data between processor and I/O module.
  - b. **Command decoding :** The I/O module for a disk drive may accept the following commands from the processor : READ SECTOR, WRITE SECTOR, SEEK track, etc.

3. **Control and timing :** The I/O module is able to co-ordinate the flow of data between the internal resources (such as processor, memory) and external devices.
2. **Device communication :** The I/O module is able to perform device communication such as status reporting.
3. **Data buffering :**
  - a. This is necessary as there is a speed mismatch between speed of data transfer between processor and memory and external devices.
  - b. Data coming from the main memory are sent to an I/O module in a rapid burst.
  - c. The data is buffered in the I/O module and then sent to the peripheral device at its rate.
4. **Error detection :**
  - a. The I/O module is able to detect errors and report them to the processor.
  - b. These errors may be mechanical errors (such as paper jam in a printer), or changes in the bit pattern of transmitted data. A common way of detecting such errors is by using parity bits.

- Que 5.3.** Explain I/O bus and I/O command.

#### Answer

I/O bus :

1. The I/O bus consists of data lines, address lines and control lines.
2. It acts as a communication link between processor and several peripheral devices.
3. It comprises of magnetic tape, magnetic disk, printer and terminal.
4. The I/O bus from processor is attached to all peripheral interfaces.

#### I/O command :

When an address is in the address lines, at the same time, the processor provides a function code in control lines which is referred to as I/O command. It is of four types :

- i. **Control command :** It is issued to activate the peripheral and to inform it what to do.
- ii. **Status command :** It is used to test various status conditions in the interface and peripheral.

- iii.** **Output data command :** It causes the interface to respond by transferring data from bus into one of its registers.
- iv.** **Input data command :** It is the opposite of data output. The interface receives an item of data from peripheral and places it in its buffer register.

**PART-2****Interrupts : Interrupt Hardware, Types of Interrupts and Exceptions.****Questions-Answers****Long Answer Type and Medium Answer Type Questions****Que 5.4.** Write a short note on interrupts.**AKTU 2014-15, Marks 05****OR**

Define interrupt. When a device interrupt occurs how does the processor determine which device has issued the interrupt?

**Answer**

**Interrupt :** An interrupt is a signal sent by an I/O interface to the CPU when it is ready to send information to the memory or receive information from the memory.

**Identifying the source of an interrupt :**

Two methods are available to determine the interrupting device :

**a. Polled interrupts :**

1. On receiving an interrupt request the micro-processor will execute a routine causing it to poll each of the devices in turn.
2. Devices have a status register containing one or more interrupt request bits.
3. If a device caused the interrupt, its interrupt flag bit will be set.
4. The appropriate service routine will then be selected and the device serviced.
5. Polling can be very inefficient if there are many devices capable of causing an interrupt.
6. This method uses only software methods to identify an interrupting device.

**b. Vectored interrupts :**

1. This is the method used in modern computers.
2. It is sometimes referred to as hardware identification since additional hardware is required.

Computer Organization & Architecture

- Computer Organization is identified by an interrupt number from 0 to 255 and each vector is identified by an interrupt number from 0 to 255 and provides the processor with the means of addressing the appropriate interrupt handler.
- A vector address is determined by multiplying its vector number by 4.

**Que 5.5.** Explain the sequence that takes place when an interrupt occurs.**Answer**

When an interrupt occurs, sequence of following six steps takes place :

**1. Interrupt recognition :**

- The interrupt recognition is recognized by the processor of an interrupt request due to activation of an interrupt request line or an internal mechanism.

- a. In this step, the processor can determine which device or CPU, component made the request.
- b. The goal of this step is to make the interrupt sequence transparent to the interrupted process.

**2. Status saving :**

- a. Therefore, the processor saves the flags and registers that may be changed by the interrupt service routine so that they may be restored after the service routine is finished.
- b. For the first few steps of the sequence, all interrupts are masked out so that no other interrupt may be processed before the processor status is saved.

**3. Interrupt masking :**

- a. The mask is then set to accept interrupts of higher priority.
- b. At some point, the processor must acknowledge the interrupt being serviced, so that the interrupting device becomes free to continue its task.

**4. Interrupt acknowledgment :**

- a. One of the ways is to have an external signal line denoted to interrupt acknowledge.
- b. At this point, the processor initiates the interrupt service routine.
- c. The address of the routine can be obtained in several ways, depending on the system architecture.

**AKTU 2015-16, Marks 10**

**6. Restoration and return :**

- a. After the interrupt service routine has completed its processing, it restores all the registers it has changed, and the processor resumes all the registers and flags that were saved at the initiation of the interrupt routine.

- b. If this is done correctly, the processor should have the same status as before the interrupt was recognized.

**Que 5.6. How system resolve the priority of interrupt ?**

**OR**

**Explain polling and daisy chaining method.**

**Answer**

There are two methods of system to resolve the priority of interrupt:

**a. Polling method :**

1. When interrupt requests arrive from two or more devices simultaneously, the processor has to decide which request should be serviced first and which one should be delayed.

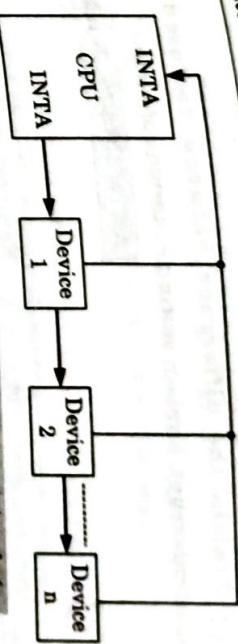

2. The processor takes the decision with the help of interrupt priorities. It accepts the request having the highest priority.

3. In this case polling is used to identify the interrupting device, priority is automatically assigned by the order in which devices are polled.

4. Therefore, no further arrangement is required to accommodate simultaneous interrupt requests. However, the priority of any device is usually determined by the way the device is connected to the processor.

**b. Chaining method :**

1. Most common way to connect the devices is to form a daisy chain, as shown in Fig. 5.6.1.
2. The Interrupt Request line (INTR) is common to all the devices and the Interrupt Acknowledge line (INTA) is connected in a daisy chain model.
3. In daisy chain fashion the signal is allowed to propagate serially through the devices.
4. When more than one devices issue an interrupt request, the INTR line is activated and processor responds by setting the INTA line.

**Fig. 5.6.1. Interrupt priority system using daisy chain.**

5. This signal is received by device 1. Device 1 passes the signal to the device 2 only if it requires any service.
6. If device 1 requires service, it blocks the INTA line and puts its identification code on the data lines. Therefore, in daisy chain arrangement, the device that is electrically closest to the processor has the highest priority.

**Que 5.7. How interrupts are classified ?**

Basically the interrupts can be classified in the following three ways :

**1. Hardware and software interrupts :**

- a. The interrupts initiated by an external hardware by sending an appropriate signal to the interrupt pin of the CPU is called hardware interrupt.

- b. The software interrupts are program instructions. These instructions are inserted at desired location in a program. While running a program, if software interrupt instruction is encountered the CPU initiates an interrupt.

**2. Vectored and non-vectored interrupts :**

- a. When an interrupt signal is accepted by the CPU, and the program control automatically branches to a specific address (called vector address) then the interrupt is called vectored interrupt.

- b. In non-vectored interrupts the interrupting device should supply the address of the ISR to be executed in response to the interrupt.

**3. Maskable and non-maskable interrupts :**

- a. The interrupts whose request can be either accepted or rejected by the CPU are called maskable interrupts.
- b. The interrupts whose request has to be definitely accepted by the CPU are called non-maskable interrupts.

**Que 5.8.** Explain the difference between vectored and non-vectored interrupt. Explain stating examples of each.

**Answer** AKTU 2018-19, Marks 07

S.No.	Vectored interrupt	Non-vectored interrupt
1.	Vectored interrupt are those interrupt that generates the interrupt request, identifies itself directly to the processor.	Non-vectored interrupt those in which vector address are not pre-defined.
2.	Vector interrupt have fixed memory location for transfer of control for normal execution.	Non-vectored interrupt do not have fixed memory location for transfer of control for normal execution.
3.	Vectored interrupt has memory address.	A non-vectored interrupt do not have memory address.
4.	The vectored interrupt allows the CPU to be able to know what ISR to carry out in software.	When a non-vectored interrupt received, it jump into the program counter to fixed address in hardware.
5.	Response time is low.	Response time is high.
6.	TRAP is a vectored interrupt.	INTR is non-vectored interrupt.

**Que 5.9.** Explain the types of interrupt on the basis of timer.

**Answer**

There are following types of interrupt on this basis of timer :

**1. Level-triggered :**

- a. A level-triggered interrupt is a class of interrupts where the presence of an unserviced interrupt is indicated by a high level (1), or low level (0), of the interrupt request line.
- b. A device wishing to signal an interrupt drives line to its active level, and then holds it at that level until serviced.

**2. Edge-triggered :**

- a. An edge-triggered interrupt is a class of interrupts that are signaled by a level transition on the interrupt line, either a falling edge (1 to 0) or a rising edge (0 to 1).

- b. A device wishing to signal an interrupt drives a pulse onto the line and then releases the line to its quiescent state.

- c. If the pulse is too short to be detected by polled I/O then special hardware may be required to detect the edge.

**3. Hybrid :**

- a. Some systems use a hybrid of level-triggered and edge-triggered signaling. The hardware not only looks for an edge, but it also verifies that the interrupt signal stays active for a certain period of time.
- b. A common use of a hybrid interrupt is for the NMI (non-maskable interrupt) input.
- c. Because NMIs generally signal major or even catastrophic system events, a good implementation of this signal tries to ensure that the interrupt is valid by verifying that it remains active for a period of time.

**PART-3**

**Modes of Data Transfer : Programmed I/O.**

**Questions-Answers**

**Long Answer Type and Medium Answer Type Questions**

**Que 5.10.** Write a short note on programmed I/O.

**OR** AKTU 2014-15, Marks 05

Discuss the programmed I/O method for controlling input-output operations.

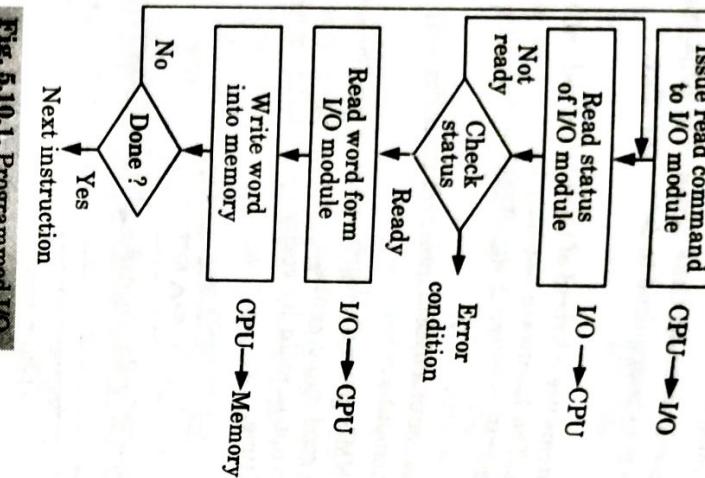

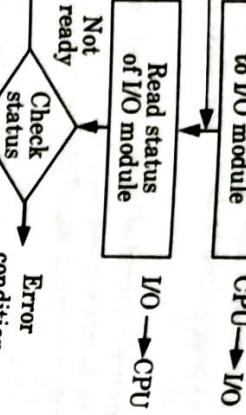

**Answer**

**Programmed I/O :**

1. When the CPU is executing a program and executes an instruction relating to I/O, it executes that instruction by issuing a command to the appropriate I/O module.

**Answer**

Interrupt initiated I/O is a mode of data transfer which removes the drawback of the programmed I/O mode.

**Fig. 5.10.1. Programmed I/O.**

2. With programmed I/O, the I/O module will perform the requested action and then set the appropriate bits in the I/O status register.
3. The I/O module takes no further action to alert the CPU.
4. It does not interrupt the CPU.
5. Thus, it is the responsibility of CPU to periodically check the status of the I/O module until it finds that the operation is complete.

#### PART-4

*Interrupt Initiated I/O and Direct Memory Access, I/O Channels and Processors.*

#### Questions-Answers

#### Long Answer Type and Medium Answer Type Questions

#### Que 5.11.

What is interrupt initiated I/O ?

**Answer**

1. DMA stands for "Direct Memory Access" and is a method of transferring data from the computer's RAM to another part of the computer without processing it using the CPU.
2. While most data that is input or output from our computer is processed by the CPU, some data does not require processing, or can be processed by another device.
3. DMA can save processing time and is a more efficient way to move data from the computer's memory to other devices.
4. In order for devices to use direct memory access, they must be assigned to a DMA channel. Each type of port on a computer has a set of DMA channels that can be assigned to each connected device.

**Que 5.12.** Write short note on DMA. AKTU 2014-15, Marks 05

**OR**

Explain the working of DMA controller with the help of suitable diagrams.

Write a short note on DMA based data transfer.

**AKTU 2018-19, Marks 07**

**OR**

Give the block diagram of DMA controller. Why are the read and write control lines in a DMA controller bidirectional ?

**AKTU 2018-19, Marks 07**

**Answer**

**DMA :**

1. DMA stands for "Direct Memory Access" and is a method of transferring data from the computer's RAM to another part of the computer without processing it using the CPU.
2. While most data that is input or output from our computer is processed by the CPU, some data does not require processing, or can be processed by another device.
3. DMA can save processing time and is a more efficient way to move data from the computer's memory to other devices.
4. In order for devices to use direct memory access, they must be assigned to a DMA channel. Each type of port on a computer has a set of DMA channels that can be assigned to each connected device.

**Advantage of isolated I/O:**

1. The devices of I/O are treated in a separate domain as compared to memory.
2. A total of 1MB address space is allowed for memory applications.
3. In order to maximize the I/O operations (isolated) separate instructions are always provided to perform these operations.

**Disadvantage of isolated I/O :**

1. The data transfer only occurs between the I/O port and the registers.

**Advantages of memory mapped I/O :**

1. I/O intensive operation is fast.
2. The SQLite library needs less RAM.

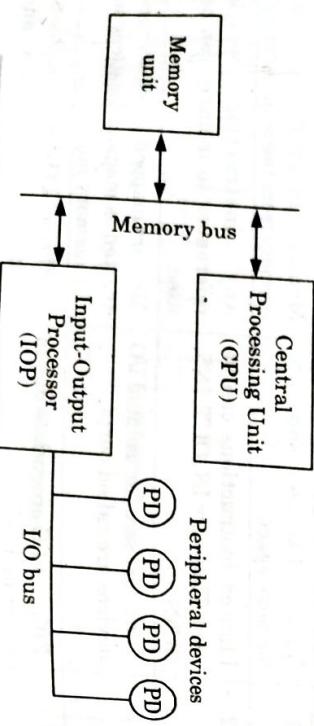

**Disadvantages of memory mapped I/O :**

1. If an I/O error on a memory-mapped file cannot be caught by the application, results in a program crash.
2. Performance is reduced by the use of memory-mapped I/O.

**Que 5.14. What do you mean by Input-Output (I/O) processor ?****Answer**

1. IOP is designed to handle the details of I/O processing. Unlike the DMA controller that must be set up entirely by the CPU, the IOP can fetch and execute its own instructions.

2. IOP instructions are specifically designed to facilitate I/O transfers.

**Fig. 4.14.1. The block diagram of a computer with IOP.**

3. The memory unit occupies central position and can communicate with each processor by means of direct memory access.
4. The CPU is responsible for processing data. The IOP provides a path for transfer of data between various peripheral devices and the memory unit.

Computer Organization & Architecture  
Computer assigns the task of initiating the I/O program. From then on the CPU assigns the task of the CPU and continues to transfer data from external devices and memory.

**Que 5.15. Explain I/O channels with its types.****Answer**

1. A channel is an independent hardware component that co-ordinate all I/O to a set of controllers. Computer systems that use I/O channel have special hardware components that handle all I/O operations.
2. Channels use separate, independent and low cost processors for its functioning which are called channel processors.
3. Channel processors are simple, but contains sufficient memory to handle all I/O tasks.
4. When I/O transfer is complete or an error is detected, the channel controller communicates with the CPU using an interrupt, and informs CPU about the error or the task completion.
5. Each channel supports one or more controllers or devices. Channel programs contain list of commands to the channel itself and for various connected controllers or devices.

**Types of I/O Channels :**

1. **Multiplexer** : The Multiplexer channel can be connected to a number of slow and medium speed devices. It is capable of operating number of I/O devices simultaneously.
2. **Selector** : This channel can handle only one I/O operation at a time and is used to control one high speed device at a time.
3. **Block-Multiplexer** : It combines the features of both multiplexer and selector channels.

**PART-5**

*Serial Communication : Synchronous and Asynchronous Communication, Standard Communication Interfaces.*

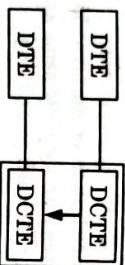

**Questions-Answers****Long Answer Type and Medium Answer Type Questions****Que 5.16. What do you mean by serial communication ? What are the transmission modes of serial communication ?**

**Answer**

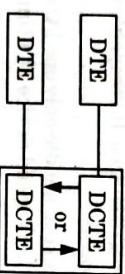

- In serial communication bits are transferred one after the other over a single communication path.
- Serial communication is a device communication protocol that is standard on almost every PC.
- A given transmission on a communication channel between two machines can occur in several different ways.

**Modes of serial communication :****1. Simplex connection :**

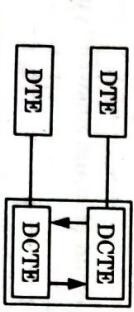

- A simplex connection is a connection in which the data flows in only one direction, from the transmitter to the receiver.

**Fig. 5.16.1. Simplex connection.****2. Half-duplex connection :**

- A half-duplex connection (sometimes called an alternating connection or semi-duplex) is a connection in which the data flows in one direction or the other, but not both at the same time.

**Fig. 5.16.2. Half-duplex connection.**

- With this type of connection, each end of the connection transmits in turn.
  - Full-duplex connection :**
- A full-duplex connection is a connection in which the data flow in both directions simultaneously.
  - This can be achieved by means of a four-wire link, with a different pair of wires dedicated to each direction of transmission.

**Fig. 5.16.3. Full-duplex connection.**

**Ques 5.17.** Explain synchronous communication and asynchronous communication.

**Answer****Synchronous communication :**

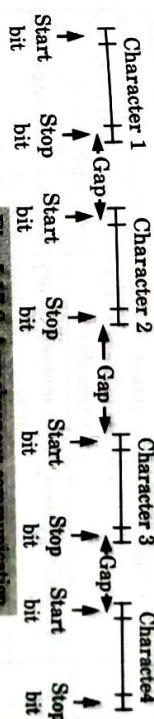

- In the synchronous communication scheme, after a fixed number of data bytes, a special bit pattern called SYNC is sent as shown in Fig. 5.17.1.

**Fig. 5.17.1. Synchronous communication.**

- There is no gap between adjacent characters in the synchronous communication.
- There is a continuous stream of data bits coming at a fixed speed in a synchronous communication scheme.
- Synchronous communication is used generally when two computers are communicating to each other or when a buffered terminal is communicating to the computer.

**Asynchronous communication :**

- In the asynchronous communication scheme, each character includes start and stop bits, as shown in Fig. 5.17.2.

**Fig. 5.17.2. Asynchronous communication.**

- There are some gaps between adjacent characters in the asynchronous communication.
- In the asynchronous communication scheme, the bits within a character frame (including start, parity and stop bits) are sent at the baud rate.
- Asynchronous communication is used when slow speed peripherals communicate with the computer.

**Ques 5.18.** Discuss the advantages and disadvantages of synchronous and asynchronous transmission.

**Answer****Advantages of synchronous transmission :**

- Lower overhead and thus, greater throughput.
- Slightly more complex.

**Disadvantages of synchronous transmission :**

- Hardware is more expensive.
- Simple and does not require synchronization of both communication sides.

2. Hardware are cheaper as clock is not required.
3. Set-up is very fast, so well suited for applications where messages are generated at irregular intervals.

**Disadvantages of asynchronous transmission :**

- Large relative overhead, a high proportion of the transmitted bits are uniquely for control purposes and thus carry no useful information.
- Strobe control and handshaking asynchronous data transfer modes.
- Processor and IOP.
- Synchronous and asynchronous transmission.
- Character-oriented and Bit-oriented protocols.
- DMA and interrupt initiated I/O techniques.

AKTU 2015-16, Marks 10

**Answer**

**i. Strobe control and handshaking asynchronous data transfer modes:**

S.No.	Parameter	Strobe control	Handshaking
1.	Control line	It employs a single control line to time each transfer.	It employs more than one control line to time each transfer.
2.	Acknowledgement	Reply message is not present.	Reply message is present.
3.	Block diagram		
4.	Timing diagram		

- iv. Character-oriented and Bit-oriented protocols:**
- | S.No. | Character-oriented protocol   | Bit-oriented protocol   |
|-------|---|---|
| 1.    | The character-oriented protocol is based on the binary code of a character set.                 | The bit-oriented protocol does not use characters in its control field and is independent of any particular code. |
| 2.    | The code has 128 characters, of which 95 are graphics characters and 33 are control characters. | It allows the transmission of serial bit stream of any length without the implication of character boundaries.    |

**Message format for character-oriented protocol:**

SYN	SYN	SOH	Header	STX	Text	ETX	BC1
Flag 0111110		Address 8 bits	Control 8 bits	Information any number of bits	Frame check 16 bits	Flag 0111110	

**Frame format for bit-oriented protocol:**

Flag	Address	Control	Information	Frame	Flag
0111110	8 bits	8 bits	any number of bits	16 bits	0111110

**v. DMA and interrupt initiated I/O techniques:**

S.No.	Processor	IOP
1.	Processor is CPU.	IOP is port of CPU processing.
2.	Handles arithmetic and logical tasks.	Handles only I/O processing
3.	DMA controller is set-up by CPU.	IOP is a processor with DMA.

**Ques 5.10.** Describe the subroutine. Write a program which move the block of data.

OR

**A.I.Y.U 2016-17, Marks 15**

Write a note on subroutines.

**Answer**

**Subroutine :**

1. A subroutine is a set of common instructions that can be used in a program many times.
2. A subroutine consists of a self-contained sequence of instructions that carries out a given task.
3. Each time that a subroutine is used in the main part of the program, a branch is executed to the beginning of the subroutine.
4. After the subroutine has been executed, a branch is made back to the main program.
5. A branch can be made to the subroutine from any part of the main program.
6. Because branching to a subroutine and returning to the main program is such a common operation, all computers provide special instructions to facilitate subroutine entry and return.

**Program :**

```

LXI H, XX50H      ; Set up HL as a pointer for the source memory
LXI D, XX70H      ; Set up DE as a pointer for the destination
                  ; memory
MVI B, 10H        ; Set up B as byte counter
NEXT: MOV A,M      ; Get data byte from the source memory
STAX D            ; Store the data byte in destination memory
INX H             ; Get ready to transfer next byte
DCR B             ; Go back to get next byte if byte counter ≠ 0
JNZ NEXT          ; Go back to get next byte if byte counter ≠ 0
HLT

```

### VERY IMPORTANT QUESTIONS

*Following questions are very important. These questions may be asked in your SESSIONALS as well as UNIVERSITY EXAMINATION.*

Q. 1. Why input-output interface is required ? Describe in detail.

Refer Q. 5.2.

Q. 2. Write a short note on interrupts.

Refer Q. 5.4.

Q. 3. Explain the sequence that takes place when an interrupt occurs.

Refer Q. 5.5.

Q. 4. Explain the difference between vectored and non-vectorized interrupt. Explain stating examples of each.

Refer Q. 5.8.

Q. 5. Write a short note on programmed I/O.

Refer Q. 5.10.

Q. 6. Write a short note on DMA based data transfer.

Refer Q. 5.12.

Q. 7. What is the difference between isolated I/O and memory mapped I/O ? Explain the advantages and disadvantages of each.

Refer Q. 5.13.

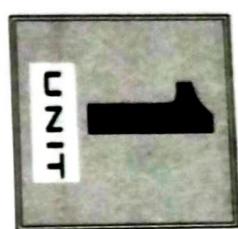

Q. 8. Differentiate among:

- i. Strobe control and handshaking asynchronous data transfer modes.
- ii. Processor and IOP.
- iii. Synchronous and asynchronous transmission.
- iv. Character-oriented and Bit-oriented protocols.
- v. DMA and interrupt initiated I/O techniques.

Q. 9. Describe the subroutine. Write a program which move the block of data.

Refer Q. 5.20.

## Central Processing Unit (2 Marks Questions)

**1.1. What are the various ways of specifying the binary point in a register ?**

**Ans.** There are two ways of specifying the binary point in a register which are :

- By giving it a fixed position.
- By employing a floating-point representation.

**1.2. What are the various facts related to bus and bus system ?**

**Ans.** Various facts related to bus and bus system are :

- A bus system will multiplex  $k$  registers of  $n$  bits each to produce an  $n$ -line common bus.
- The number of multiplexers needed to construct the bus is equal to  $n$ , the number of bits in each register.
- The size of each multiplexer must be  $k \times 1$ , since it multiplexes  $k$  data lines.

**1.3. Give various advantages of polling method.**

**Ans.** Various advantages of polling method are :

- The priority can be changed by altering the polling sequence stored in the controller.
- If one module fails, entire system does not fail.

**1.4. Discuss the basic component of register transfer logic.**

**Ans.** Basic components of register transfer logic are :

- Registers and their functions
- Information
- Operations
- Control function

**1.5. What is the relation between bus width and number of bit transferred ?**

**Ans.** Bus width is directly proportional to the number of bit transferred. The wider the data bus, then greater will be the number of bits transferred at one time.

**1.6. Define memory transfer.**

**Ans.** Memory transfer involves basic operation like fetch (read) or store (write). The fetch operation transfers a copy of content from memory location to CPU. The store operation transfers the word information from CPU to specific memory location.

**AKTU 2015-16, Marks 02**

**1.7. Define bus transfer.**

**Ans.** The data transfer between various blocks connected to the common bus is called bus transfer. Common bus system is shared by all the units.

**1.8. Explain control word.**

**Ans.** Control word is defined as a word whose individual bits represent the various control signals. Therefore each of the control steps in the control sequence of an instruction defines a unique combination of 0s and 1s.

**1.9. Compare register stack and memory stack.**

S.No.	Register stack	Memory stack
1.	A stack can be placed in a portion of a logical memory or can be organized as a collection of number of memory words or registers.	The stack is implemented as a standalone and also implemented as a random access memory attached to CPU.
2.	The stack pointer register (SP) contains a binary number whose value is equal to address of the word that is currently on top of the stack.	The implementation of a stack in the CPU is done by assigning a portion of memory to a stack operation.

# 2

## UNIT

### (2 Marks Questions)

**2.1. What is look ahead carry adder?**

**Note:** A look ahead carry adder is a type of adder which improves the speed by reducing the amount of time required to determine carry bits.

**2.2. What is arithmetic and logic circuit?**

**Note:** Arithmetic circuit : It is a digital circuit which performs only arithmetic operations such as addition, subtraction etc.  
Logic circuit : It is a digital circuit which perform only logic operations such as AND, OR and NOT etc.

**2.3. Define following terms:**

- RTL
- Micro-operation

**AKTU 2016-17, Marks 02**

**i. RTL :** Register Transfer Language (RTL) is a convenient tool for describing the internal organization of digital computers in concise and precise manner. It can also be used to facilitate the design process of digital systems.

**ii. Micro-operation :** The processor unit has to perform a set of operations to execute the major phases of instruction cycle these set of operations called micro-operations.

**2.4. What is the main advantage of RTL?**

**AKTU 2015-16, Marks 02**

**i. Advantage of RTL are:**  
It uses register's as a primitive component in the digital system instead of flip-flops and gates.

**ii.** It describes the information flow and processing tasks among the data stored in the registers in a concise and precise manner.  
**iii.** It uses a set of expressions and statements which resemble the statements used in programming languages.  
**iv.** The presentation of digital functions in register transfer logic is very user friendly.

**2.5. What is the need of having many addressing modes in machine?**

**sq-4 B (CSIT-Sem-3)**  
Need of having many addressing modes in machine is due to following reason :  
to following reason :  
The way of operands are chosen during program execution is dependent on the addressing mode of the instruction.  
The addressing mode specifies a rule for interpreting or modifying the address field of the instruction before the operand is actually referenced.

**2.6. How subtraction operation and other operations can be simplified in a digital system?**

**Note:** Subtraction operation and other operations can be simplified in a digital system by using complement method. For each number system, there are two types of complement :

- $r^r$ 's complement
- $(r-1)$ 's complement

**2.7. How many flip-flops are needed for 4-bit decimal code and 4385 in BCD representations?**

**Note:** For 4-bit decimal code, there are 4 flip-flops used, each for one bit.  
For 4385 in BCD representation, there are 16 flip-flops used.

**2.8. State the condition for floating-point number to become normalized.**

**Note:** A floating-point number is said to be normalized if the most significant digit of the mantissa is non-zero.

**2.9. When exponent overflow and underflow occur ?**

**Note:** Exponent overflow occurs when a positive exponent exceeds the maximum possible exponent value.  
Exponent underflow occurs when a negative exponent exceeds the maximum possible exponent value. In such cases, the number is designed is zero.

**2.10. Perform the following operation on signed numbers using 2's compliment method :  $(56)_{10} + (-27)_{10}$**

**AKTU 2017-18, Marks 01**

$$\begin{array}{r} 56 = 11000 \text{ (binary form)} \\ + 56 = 011000 \text{ (signed binary form)} \\ - 27 = 011011 \text{ (binary form)} \\ \hline \end{array}$$

$100100$  (1's complement)

$+ 1$

$100101$  (2's complement)

$$\begin{array}{r} -27 = 1100101 \text{ (signed binary form)} \\ \hline \end{array}$$

$$\begin{array}{r} (+ 56)_{10} + (- 27)_{10} = 011000 \\ \hline \end{array}$$

$$\begin{array}{r} now, (+ 56)_{10} + (- 27)_{10} = 1100101 \\ \hline \end{array}$$

$$\begin{array}{r} 0001101 \\ \hline \end{array}$$

$$\begin{array}{r} (001101_2) \\ \hline \end{array}$$

$$\begin{array}{r} (29)_{10} \\ \hline \end{array}$$

# 3

## Control Unit (2 Marks Questions)

### 3.1. Explain one, two and three address instruction.

**AKTU 2016-17, Marks 02**

- One address instruction : One address instruction uses an implied accumulator (AC) register for all data manipulation.
- Two address instruction : In this format each address field can specify either a processor register or a memory word.
- Three address instruction : Three address instruction formats can use each address fields to specify either a processor register or a memory operand.

### 3.2. What are the various facts related to operation code ?

- The number of bits required for the operation code of an instruction depends on the total number of operations available in the computer.
- The operation code must consist of at least  $n$  bits for a given  $2^n$  distinct operations.

### 3.3. Define the necessary factors for instruction sequencing.

- Ans.** Necessary factors for instruction sequencing are:
- It needs a counter to calculate the address of next instruction after execution of current instruction is completed.
  - It is also necessary to provide a register in the control unit for storing the instruction code.

### 3.4. What operations are included in micro-operations ?

- Ans.** Micro-operations includes :
- Transfer a word of data from one CPU register to another or to the ALU.
  - Perform the arithmetic or logic operations on the data from the CPU registers and store the result in a CPU register.
  - Fetch a word of data from specified memory location and load them into a CPU register.

- SQ-6 B (CSIT-Sem-3)**
- Effective address
  - Immediate instruction
  - Effective address : Effective address is the address of the operand in a computation-type instruction or the target address in a branch-type instruction.
  - Store a word of data from a CPU register into a specified memory location.

**AKTU 2016-17, Marks 02**

- 3.5. Define the following terms :**
- Effective address
  - Immediate instruction

- Ans.** i. **Effective address** : Effective address is the address of the operand in a computation-type instruction or the target address in a branch-type instruction.

- ii. **Immediate instruction** : An immediate mode instruction has an operand field rather than an address field. The operand field contains the actual operand to be used in conjunction with the operation specified in the instruction.

- 3.6. What does the processor do when an interrupt is pending?**
- Ans.** If an interrupt is pending, the processor does the following:
- It suspends execution of the current program being executed and saves its context.
  - It sets the program counter to the starting address of an interrupt handler routine.

### 3.7. Define the goal of CISC architecture.

- Ans.** The goal of CISC architecture is to provide a single machine instruction for each statement that is written in high-level language.

### 3.8. Compare horizontal and vertical organization.

S.No.	Horizontal organization	Vertical organization
1.	Long formats.	Short formats.
2.	Ability to express a high degree of parallelism.	Limited ability to express parallel micro-operations.
3.	Little encoding of control information.	Considerable encoding of the control information.
4.	Useful when higher operating speed is desired.	Slower operating speed.

- 3.9. Describe the micro-program sequencing.**

- Ans.** The simple approach of micro-programming is sequential execution of micro-instructions, except for the branch at the end of the fetch phase.

**3.10. What is the problem with simple micro-instruction?**

The micro-program requires several branch micro-instructions? These instructions perform no useful operation in data path. They are needed only to determine the address of next micro-instruction. Thus, they de-tract the operating speed of computer.

**3.11. List two important instruction set design issues.****AKTU 2015-16, Marks 02**

**Two important instruction set design issues are :**

- Data types : The various types of data upon which operations are performed.
- Registers : Number of CPU registers that can be referenced by instructions and their use.

**3.12. Define sequencer.****AKTU 2015-16, Marks 02**

A sequencer generates the addresses used to step through the micro-program of a control store. It is used as a part of control unit of CPU for address ranges.

**3.13. List the two techniques used for grouping the control signals.****AKTU 2015-16, Marks 02**

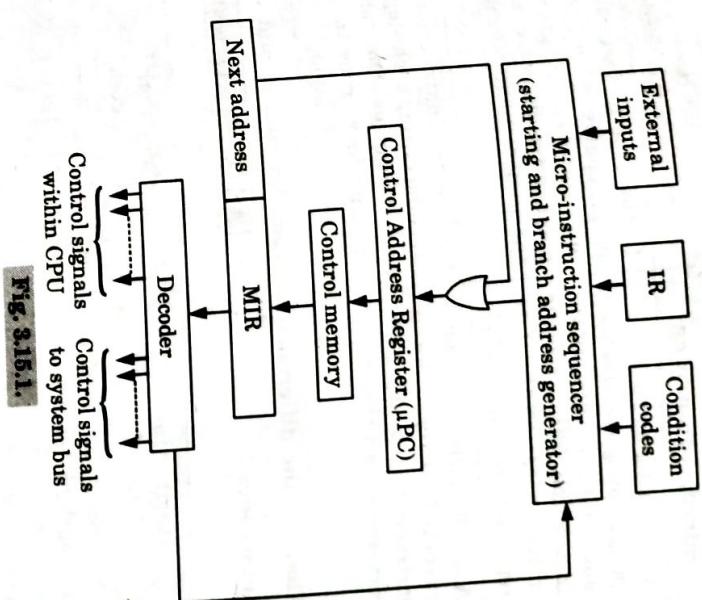

**The two techniques used for grouping the control signal are :**

- Hardwired control unit
- Micro-programmed control unit

**3.14. List three types of control signals.****AKTU 2015-16, 2018-19; Marks 02**

**Three types of control signals are :**

- ALU
- Data paths
- System

**3.15. Draw the block diagram of micro-program sequencer.****AKTU 2015-16, Marks 02****3.16. Write short note on pipelining process.****AKTU 2017-18, Marks 02**

**Pipelining means realizing temporal parallelism in an economical way. In this, the problem is divided into a series of tasks that have to be completed one after the other.**

**3.17. Differentiate between horizontal and vertical microprogramming.****AKTU 2017-18, Marks 02**

## (2 Marks Questions)

### Memory

- Ques.** 3.18. What are the difference between horizontal and vertical micro codes ?
- AKTU 2018-19, Marks 02**
- | S.No. | Horizontal micro code  | Vertical micro code   |
|-------|--|---|
| 1.    | In this types of code the micro code contains the control signal without any intermediary.                         | In case of vertical micro code every action is encoded in density.  |
| 2.    | Horizontal micro code instruction contain a lot of signals and hence due to that the number of bits also increase. | Vertical micro code are slower but they take less space and their actions at execution time need to be decoded to a signal. |

- Ques.** 4.1. What are the requirements of memory ? There are three requirements of memory which are following :

- It should be fast.
- It should be large.
- It should be inexpensive.

- Ques.** 4.2. Differentiate between SRAM and DRAM.

**AKTU 2018-19, Marks 02**

S.No.	Static RAM	Dynamic RAM
1.	Static RAM contains less memory cells per unit area.	Dynamic RAM contains more memory cells as compared to static RAM per unit area.
2.	It has less access time hence faster memories.	Its access time is greater than static RAMs.
3.	Cost is more.	Cost is less.

- Ques.** 4.3. What do you mean by programming of ROM ? The blowing of fuses in a cell, according to the truth table is called programming of ROM. The PROMs are one time programmable. Once programmed, the information stored is permanent.

- Ques.** 4.4. Give the difference between PROM and EEPROM.

S.No.	PROM	EEPROM
i.	It is one-time programmable ROM.	It can be programmed more than once.
ii.	PROM destroys the entire data when applied with high voltage.	It allows selective erasing at the register level.

**SQ-12 B (CSIT-Sem-3)****Computer Organization & Architecture****SQ-11 B (CSIT-Sem-3)****4.5. Why auxiliary storage is organized in records or blocks?**

- ANS** Auxiliary storage is organized in records or blocks because the seek time is usually much longer than the transfer time.

**4.6. What is CAM ?****AKTU 2015-16, 2017-18; Marks 02**

- ANS** A Content Addressable Memory (CAM) is a circuit that combines comparison and storage in a single device. Instead of supplying an address and reading a word like a RAM, we supply the data and the CAM looks to see if it has a copy and returns the index of the matching row.

**4.7. Which of L1 and L2 cache is faster ?****AKTU 2015-16, 2017-18; Marks 02**

- ANS**
- All processors rely on L1 cache, which is usually located on the processor and is very fast memory and expensive.
  - L2 cache is slower, bigger and cheaper than L1 cache.

**4.8. What is cache memory used for ?****AKTU 2016-17, Marks 02**

- ANS**
- Cache memory is used to store frequently used data or instructions.
  - Cache memory is used to improve computer performance by reducing its access time.
  - A cache holds instructions and data that are likely to be needed for the CPU's next operation.

**4.9. Give the disadvantage of direct mapping.**

- ANS** The disadvantage of direct mapping is that the hit ratio can drop considerably if two or more words whose addresses have the same index but different tags are accessed repeatedly.

**4.10. Define access time, seek time and latency time.**

- ANS** **Access time :** The disk access time is the time delay between receiving an address and the beginning of actual data transfer.

**Seek time :** The seek time is the time required to move the read/write head to the proper track.

**Latency time :** The rotational delay also known as latency time is the amount of time that elapses after the head is positioned over the correct track until the starting position of the addressed section passes under the read/write head.

**4.11. Discuss the advantages of erasable optical disk.****4.13. What is memory management unit ?**

- ANS** Memory Management Unit (MMU) is the hardware component in the computer that handles virtual memory. Any request for data is sent to the MMU which then determines the location of the information; whether it is in RAM or on a permanent storage drive. The MMU is usually located on our machine's CPU and holds a table for matching physical memory addresses to virtual ones.

**4.14. Explain the following terms :****AKTU 2016-17, Marks 02**

- PSW** : The collection of all status bit conditions in the CPU is sometimes called a program status word or PSW.
- Delayed load** : It includes the status bits from the last ALU operation and whether the interrupt that are allowed to occur and whether the CPU is operating in a supervisor or user mode.

**i. PSW (Program Status Word) :** The PSW is stored in a separate hardware register and contains the status information that characterizes the state of the CPU.

**ii. Delayed load :** It is up to the compiler to make sure that the instruction following the load instruction uses the data fetched from memory.

- If the compiler cannot find a useful instruction, it inserts a no-op (no-operation) instruction but has no operation, thus wasting a clock cycle.
- This concept of delaying the use of the data loaded from memory is referred to as delayed load.

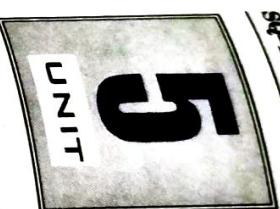

**4.15. What do you understand by locality of reference?**

**ANS** Locality of reference is a term for the phenomenon in which the same values or related storage locations are frequently accessed depending on the memory access pattern.

**4.16. Write the difference between RAM & ROM.**

**AKTU 2017-18, Marks 02**

S.No.	RAM	ROM
1.	A random access memory (RAM) device allows data items to be read or written in almost the same amount of time irrespective of the physical location of data inside the memory.	The read only memory (ROM) is a type of semiconductor memory that is designed to hold data that is either permanent or will not change frequently. It is also known as non-volatile memory.
2.	Types of RAM: i. Dynamic random access memory (DRAM) ii. Static random access memory (SRAM)	Types of ROM: i. Programmable read only memory (PROM) ii. Erasable programmable read only memory (EPROM)

## (2 Marks Questions)

### Input/Output

**5.1. Why I/O devices cannot be connected directly to the system bus?**

**ANS** I/O devices cannot be connected directly to the system bus for the following reasons:

i. A variety of peripherals with different methods of operation are available. So, it would be impractical to incorporate the necessary logic within the CPU to control a range of devices.

ii. Generally, the peripherals used in a computer system have different data formats and word lengths than that of CPU used in it.

**5.2. What is function of I/O interface?**

**ANS** Function of I/O interface enables transfer of data between internal storage and external I/O devices.

1. Input-output interface enables transfer of data between internal storage and external I/O devices.  
2. In order to interface peripherals with the CPU, I/O interfaces contain special communication links. These communication links are used to overcome, the difference between the CPU and peripheral such as data transfer speed, mode of operation, etc.

**5.3. Compare memory and I/O bus.**

S.No.	Memory bus	I/O bus
1.	Memory bus shares entire address range.	I/O bus shares only I/O address range.
2.	Memory bus width is greater than I/O bus width.	I/O bus width is smaller than memory bus width.
3.	Memory bus includes data bus, address bus and control signals to access memory.	I/O bus includes data bus, address bus and control signals to access I/O.

**5.4. State the drawbacks of programmed I/O and interrupt driven I/O.**

**Ques.** Drawbacks of programmed I/O and interrupt driven I/O.

- i. The time that the CPU spends testing I/O device status driven a number of instructions for I/O data transfer can often be spent on other task.  
ii. The I/O transfer rate is limited by the speed with which the CPU can test and service a device.

**Ques.** Compare programmed I/O and interrupt driven I/O.

S. No.	Programmed I/O	Interrupt driven I/O
1.	It is implemented without interrupt hardware support.	It is implemented using interrupt hardware support.
2.	It does not depend on interrupt status.	Interrupt must be enabled to process interrupt driven I/O.
3.	It does not need initialization of stack.	It needs initialization of stack.

**Ques.** Give comparison between I/O program controlled transfer and DMA transfer.

S. No.	I/O program controlled transfer	DMA transfer
1.	Software controlled data transfer.	Hardware controlled data transfer.
2.	Data transfer speed is low.	Data transfer speed is high.
3.	CPU is involved in the transfer.	CPU is not involved in the transfer.
4.	Extra hardware is not required.	DMA controller is required to carry-out data transfer.

**Ques.** State the characteristics of I/O channel.

- i. An I/O channel has a special-purpose processor.  
ii. The I/O instructions are stored in main memory.  
iii. The I/O program specifies the devices, the area of memory storage, priority and actions to be taken for certain error conditions.

**Ques.** Explain the type of I/O channels.

- i. Selector channel  
ii. Multiplexer channel

**Ques.** What are the modes of data transfer?

AKTU 2016-17, Marks 02

**Ques.** Modes of data transfer are :

- i. Programmed I/O : Programmed I/O operations are the result of I/O instructions written in computer program.  
ii. Interrupt-driven I/O : This mode avoids the drawbacks of programmed I/O by using interrupt request.

- iii. Direct memory access : The interface transfers data onto and out of the memory unit through memory bus.

**Ques.** Differentiate between synchronous and asynchronous transmission.

AKTU 2016-17, Marks 02

**Ques.** What is an interrupt ?

1. An interrupt is a signal sent by an I/O interface to the CPU when it is ready to send information to the memory or receive information from the memory.  
2. When a CPU receives an interrupt signal it stops executing current normal program.  
3. After stopping it saves the state of various registers in stack.  
4. When this is done CPU executes a subroutine in order to perform the specific task requested by the interrupt.

**Ques.** Differentiate between synchronous and asynchronous transmission.

AKTU 2016-17, Marks 02

**Ques.** Synchronous serial communication**Ques.** Asynchronous serial communication

S. No.	Synchronous serial communication	Asynchronous serial communication
1.	Transmitter and receivers are synchronized by clock.	Transmitter and receivers are not synchronized by clock.
2.	Data bits are transmitted with synchronization of clock.	Data bits are transmitted at constant rate.
3.	Data transfer takes place in blocks.	Data transfer is character-oriented.

**Ques.** Name the different types of I/O bus.

- There are four types of I/O bus which are :

- i. Control command  
ii. Status command  
iii. Output data command  
iv. Input data command

- 5.13. Why are read and write control lines in a DMA controller bidirectional ?

AKTU 2016-17, Marks 02

- Read and write control lines in a DMA controller are bidirectional so that :  
1. When a BG input is 0, the CPU can communicate with the DMA registers through the data bus to read from or write to the DMA

Registers.

**SEMI. IV) EVEN SEMESTER THEORY  
(SEM. IV) EXAMINATION, 2014-15  
COMPUTER ORGANIZATION**

Total Marks : 100

SQ-17 B (CS/IT-Sem-3)

Time : 3 Hours

SECTION - A

**Ques. 5.14. What is the use of modem in synchronous communication ?**

A modem converts digital signals into audio tones to be transmitted over telephone lines and also converts audio tones from the digital signals for machine use. The modems used in the lines to transmission have internal clocks that are set to the frequency that bits are being transmitted in the communication line.

**Ques. 5.15. Describe cycle stealing in DMA.**

AKTU 2016-18, Mark 02

1. In Direct Memory Access (DMA), cycle stealing is a method of allowing I/O controllers to read or write RAM without interfering with the CPU.

2. DMA controllers can operate in cycle stealing mode in which controller take over the bus for each byte of data to be transferred and then return control to the CPU.

**Ques. 5.16. Write the difference between serial and parallel communication.**

AKTU 2017-18, Mark 02

Basis for comparison	Serial communication	Parallel communication
Meaning	Data flows in bi-direction, bit by bit	Multiple lines are used to send data i.e., 8 bits or 1 byte at a time
Cost	Economical	Expensive
Bits transferred at 1 clock pulse	1 bit	8 bits or 1 byte
Speed	Slow	Fast
Applications	Used for long distance communication. For example, computer to computer.	Short distance. For example, computer to printer.

**Note:** 1. Attempt all questions.  
2. Make suitable assumptions wherever necessary.

(10 x 2 = 20)

1. Attempt any two parts of the following:  
a. What is a multiplexer and demultiplexer? Explain how an 8 x 1 multiplexer is out of syllabus since session 2017-18.

This question is out of syllabus since session 2017-18.  
b. Simplify the following function using K-map and draw the circuit using AND, OR, NOT gates.  
 $F(A, B, C, D) = \sum m(0, 2, 8, 9, 10, 11, 13, 15)$

This question is out of syllabus since session 2017-18.

c. Show step by step the multiplication process using booth's algorithm when (+ 15) and (- 13) numbers are multiplied.  
Assume 5 - bit registers that hold signed numbers.  
Refer Q. 2.15, Page 2-15B, Unit-2.

(10 x 2 = 20)  
Refer Q. 2.6, Page 2-8B, Unit-2.

2. Attempt any two parts of the following:  
a. What is an instruction in the context of computer organization? Explain the purpose of the various elements of an instruction with the help of a sample instruction format.

Refer Q. 3.1, Page 3-2B, Unit-3.

b. Explain the following addressing modes with the help of an example each:  
i. Direct  
ii. Register indirect  
iii. Implied  
iv. Immediate  
v. Indexed

Refer Q. 1.17, Page 1-17B, Unit-1.
